PREFACE

IN preparing this work the aim has been to furnish just so much of Trigonometry as is actually taught in our best schools and colleges. Consequently, all investigations that are important only for the special student have been omitted, except the development of functions in series. The principles have been unfolded with the utmost brevity consistent with simplicity and clearness, and interesting problems have been selected with a view to awaken a real love for the study. Much time and labor have been spent in devising the simplest proofs for the propositions, and in exhibiting the best methods of arranging the logarithmic work.

The author acknowledges his obligation to G. A. Hill, A.M., of Cambridge, Mass., to Dr. F. N. Cole, of New York, N.Y., to Professor S. F. Norris, of Baltimore, Md., and to Professor B. F. Yanney, of Alliance, Ohio. Miss M. Gertrude Cross, of Boston, Mass., has furnished the drawings for this edition.

TRIGONOMETRIC FUNCTIONS OF ACUTE ANGLES

SECTION I

ANGULAR MEASURE

As lengths are measured in terms of various conventional units, the foot, the meter, etc., so different units for measuring angles are employed, or have been proposed.

In the common or sexagesimal system the circumference of a circle is divided into 360 equal parts. The angle at the centre subtended by each of these parts is taken as the unit angle and is called a degree. The degree is subdivided into 60 *minutes*, and the minute into 60 *seconds*. Degrees, minutes, and seconds are denoted by symbols. Thus, 6 degrees 5 minutes 7 seconds is written $6^{\circ} 5' 7''$.

NOTE. The sexagesimal system was employed by the early Babylonian astronomers to conform with their year of 360 days.

In the circular system an arc of a circle is laid off equal in length to the radius. The angle at the centre subtended by this arc is taken as the unit angle and is called a *radian*.

The number of radians in 360° is equal to the number of times the length of the radius is contained in the length of the circumference. It is proved in Geometry that this number is

2π for all circles, π being equal to 3.1416, nearly. Therefore the radian is the same angle in all circles.

The circumference of a circle is 2π times the radius.

Hence, 2π radians = 360° , and π radians = 180° .

Therefore, $1 \text{ radian} = \frac{180^\circ}{\pi} = 57^\circ 17' 45''$,

and $1 \text{ degree} = \frac{\pi}{180} \text{ radian} = 0.017453 \text{ radian}$.

By the last two equations the measure of an angle can be changed from radians to degrees or from degrees to radians.

Thus, $2 \text{ radians} = 2 \times \frac{180^\circ}{\pi} = 2 \times (57^\circ 17' 45'') = 114^\circ 35' 30''$.

NOTE. The circular system came into use early in the eighteenth century. It is found more convenient in the higher mathematics, where the radians are expressed simply as numbers. Thus, the angle π means π radians, and the angle 3 means 3 radians.

On the introduction of the metric system of weights and measures at the close of the eighteenth century, it was proposed to divide the right angle into 100 equal parts called *grades*, which were to be taken as units. The grade was subdivided into 100 *minutes* and the minute into 100 *seconds*. This *French* or *centesimal* system, however, never came into actual use.

EXERCISE I

[Assume $\pi = 3.1416$.]

SECTION II

THE TRIGONOMETRIC FUNCTIONS

The sides and angles of a plane triangle are so related that any three given parts, provided at least one of them is a side, determine the shape and the size of the triangle.

Geometry shows how, from three such parts, to **construct** the triangle.

Trigonometry shows how to **compute** the unknown parts of a triangle from the numerical values of the given parts.

Geometry shows in a general way that the sides and angles of a triangle are mutually dependent. Trigonometry begins

by showing the exact nature of this dependence in the **right triangle**, and for this purpose employs the **ratios of the sides**.

FIG. 1

Let MAN (Fig. 1) be an acute angle. If from any points B, D, F in one of its sides perpendiculars BC, DE, FG are let fall to the other side, then the right triangles ACB, AED, AGF thus formed have the angle A common, and are therefore mutually equiangular and similar. Hence, the ratios of their corresponding

sides, pair by pair, are equal. That is,

$$\frac{AC}{AB} = \frac{AE}{AD} = \frac{AG}{AF}; \quad \frac{AC}{BC} = \frac{AE}{DE} = \frac{AG}{FG}; \quad \frac{BC}{AB} = \frac{DE}{AD} = \frac{FG}{AF}.$$

These ratios, therefore, remain unchanged so long as the angle A remains unchanged.

Hence, for every value of an acute angle A there are certain *numbers* that express the values of the ratios of the sides in all right triangles that have this acute angle A .

There are all together six different ratios:

I. The ratio of the opposite leg to the hypotenuse is called the **Sine of A** , and is written **$\sin A$** .

II. The ratio of the adjacent leg to the hypotenuse is called the **Cosine of A** , and is written **$\cos A$** .

III. The ratio of the opposite leg to the adjacent leg is called the **Tangent of A** , and is written **$\tan A$** .

IV. The ratio of the adjacent leg to the opposite leg is called the **Cotangent of A** , and is written **$\cot A$** .

V. The ratio of the hypotenuse to the adjacent leg is called the **Secant of A** , and is written **$\sec A$** .

VI. The ratio of the hypotenuse to the opposite leg is called the **Cosecant of A** , and is written **$\csc A$** .

These six ratios are called the Trigonometric Functions of the angle A .

To these six ratios are often added the two following functions, which also depend only on the angle A :

VII. The Versed Sine of A is $1 - \cos A$, and is written vers A .

VIII. The Coversed Sine of A is $1 - \sin A$, and is written covers A .

In the right triangle ACB (Fig. 2) let a , b , c denote the lengths of the sides opposite the acute angles A , B , and the right angle C , respectively, these lengths being all expressed in terms of a common unit. Then,

FIG. 2

$$\sin A = \frac{a}{c} = \frac{\text{opposite leg}}{\text{hypotenuse}},$$

$$\cos A = \frac{b}{c} = \frac{\text{adjacent leg}}{\text{hypotenuse}},$$

$$\tan A = \frac{a}{b} = \frac{\text{opposite leg}}{\text{adjacent leg}},$$

$$\cot A = \frac{b}{a} = \frac{\text{adjacent leg}}{\text{opposite leg}},$$

$$\sec A = \frac{c}{b} = \frac{\text{hypotenuse}}{\text{adjacent leg}},$$

$$\csc A = \frac{c}{a} = \frac{\text{hypotenuse}}{\text{opposite leg}},$$

30. Find, by means of the above table, the legs of a right triangle if $A = 20^\circ$, $c = 1$; also if $A = 20^\circ$, $c = 4$.

SECTION III

REPRESENTATION OF THE FUNCTIONS BY LINES

The functions of an angle, being ratios, are *numbers*; but we may represent them by *lines* if we first choose a unit of length, and then construct right triangles, such that the denominators of the ratios shall be equal to this unit.

The most convenient way is the following :

FIG. 3

About a point O (Fig. 3) as a centre, with a radius equal to one unit of length, describe a circle, and draw the horizontal diameter AA' and the diameter BB' perpendicular to AA' .

A circle with radius equal to 1 is called a *unit circle*.

Let $\angle AOP$ be an acute angle, and let its value (in degrees, etc.) be denoted by x . We may

regard the angle x as generated by a line OP that revolves about O from the initial position OA to the terminal position OP .

Draw $PM \perp$ to OA , $PN \perp$ to OB .

In the rt. $\triangle OMP$ the hypotenuse $OP = 1$.

Therefore, $\sin x = \frac{MP}{OP} = MP$; $\cos x = \frac{OM}{OP} = OM$.

Through A and B draw tangents to the circle meeting OP produced in T and S , respectively; then, in the rt. $\triangle OAT$ and OBS , $OA = 1$, the leg $OB = 1$, and the $\angle OSB =$ the $\angle x$. Therefore,

$$\tan x = \frac{AT}{OA} = AT; \quad \cot x = \frac{BS}{OB} = BS;$$

$$\sec x = \frac{OT}{OA} = OT; \quad \csc x = \frac{OS}{OB} = OS;$$

$$\text{vers } x = 1 - OM = MA; \quad \text{covers } x = 1 - ON = NB.$$

These eight *line* values of the functions are all expressed in terms of the radius of the circle as a unit; and it is clear that as the angle *varies in value* the *line values* of the functions will always remain equal *numerically* to the *ratio values*. Hence, in studying the changes in the functions as the angle

is supposed to vary in value, we may employ the simpler line values instead of the ratio values.

EXERCISE III

1. Represent by lines the functions of an acute angle larger than that shown in Fig. 3.

If x is an acute angle, show that:

2. $\sin x$ is less than $\tan x$.

3. $\sec x$ is greater than $\tan x$.

~~4.~~ $\csc x$ is greater than $\cot x$.

Construct the angle x , if:

5. $\tan x = 3$. ~~7.~~ $\cos x = \frac{1}{2}$. 9. $\sin x = 2 \cos x$.

6. $\csc x = 2$. 8. $\sin x = \cos x$. ~~10.~~ $4 \sin x = \tan x$.

~~11.~~ Show that the sine of an angle is equal to one-half the chord of twice the angle.

12. Find x if $\sin x$ is equal to one-half the side of a regular inscribed decagon.

Given x and y , $x + y$ being less than 90° ; construct:

13. The value of $\sin(x + y) - \sin x$.

~~14.~~ The value of $\tan(x + y) - \sin(x + y) + \tan x - \sin x$.

Given an angle x ; construct an angle y such that:

15. $\sin y = 2 \sin x$. ~~17.~~ $\tan y = 3 \tan x$.

16. $\cos y = \frac{1}{2} \cos x$. ~~18.~~ $\sec y = \csc x$.

~~19.~~ Show by construction that $2 \sin A > \sin 2A$.

20. Given two angles A and B , $A + B$ being less than 90° ; show that $\sin(A + B) < \sin A + \sin B$.

21. Given $\sin x$ in a unit circle; find the length of a line corresponding in position to $\sin x$ in a circle whose radius is r .

22. In a right triangle, given the hypotenuse c , and also $\sin A = m$, $\cos A = n$; find the legs.

SECTION IV

CHANGES IN THE FUNCTIONS AS THE ANGLE CHANGES

If we suppose the $\angle AOP$, or x (Fig. 4), to increase gradually to 90° by the revolution of the moving radius OP about O , the point P moves along the arc AB towards B , T moves along the tangent AT away from A , S moves along the tangent BS towards B , and M moves along the radius OA towards O .

FIG. 4

Hence, the lines MP , AT , OT gradually increase in length, and the lines OM , BS , OS gradually decrease. That is,

As an acute angle increases to 90° , its sine, tangent, and secant also increase, while its cosine, cotangent, and cosecant decrease.

On the other hand, if we suppose x to decrease gradually, the reverse changes in its functions occur.

If we suppose x to decrease to 0° , OP coincides with OA and is parallel to BS . Therefore, MP and AT vanish, OM becomes equal to OA , while BS and OS are each infinitely long and are represented in value by the symbol ∞ .

And if we suppose x to increase to 90° , OP coincides with OB and is parallel to AT . Therefore, MP and OS are each equal to OB , OM and BS vanish, while AT and OT are each infinite in length.

Hence, as the angle x increases from 0° to 90° ,

$\sin x$ increases from 0 to 1,

$\cos x$ decreases from 1 to 0,

$\tan x$ increases from 0 to ∞ ,
 $\cot x$ decreases from ∞ to 0,
 $\sec x$ increases from 1 to ∞ ,
 $\csc x$ decreases from ∞ to 1.

The values of the functions of 0° and of 90° are the *limiting* values of the functions of an acute angle. It is evident that for acute angles,

Sines and cosines are always less than 1;

Secants and cosecants are always greater than 1;

Tangents and cotangents have all values between 0 and ∞ .

REMARK. We are now able to understand why the sine, cosine, etc., of an angle are called *functions* of the angle. By a *function* of any magnitude is meant another magnitude which remains constant so long as the first magnitude remains constant, but changes in value for every change in the value of the first magnitude. This, as we now see, is the relation in which the sine, cosine, etc., of an angle stand to the angle.

SECTION V

FUNCTIONS OF COMPLEMENTARY ANGLES

The general form of two complementary angles is A and $90^\circ - A$.

In the rt. $\triangle ACB$ (Fig. 5),

$$A + B = 90^\circ; \text{ hence } B = 90^\circ - A.$$

Hence, putting $90^\circ - A$ for B in the formulas on p. 5,

$$\sin A = \cos B = \cos (90^\circ - A),$$

$$\cos A = \sin B = \sin (90^\circ - A),$$

$$\tan A = \cot B = \cot (90^\circ - A),$$

$$\cot A = \tan B = \tan (90^\circ - A),$$

$$\sec A = \csc B = \csc (90^\circ - A),$$

$$\csc A = \sec B = \sec (90^\circ - A).$$

FIG. 5

Therefore,

Each function of an acute angle is equal to the co-named function of the complementary angle.

NOTE. Cosine, cotangent, and cosecant are sometimes called *co-functions*; the words are simply abbreviated forms of *complement's sine*, *complement's tangent*, and *complement's secant*.

Hence, also,

Any function of an angle between 45° and 90° may be found by taking the co-named function of the complementary angle between 0° and 45° .

EXERCISE IV

1. Express as functions of the complementary angle:

$$\sin 30^\circ. \quad \tan 89^\circ. \quad \csc 18^\circ 10'. \quad \cot 82^\circ 19'.$$

$$\cos 45^\circ. \quad \cot 15^\circ. \quad \cos 37^\circ 24'. \quad \csc 54^\circ 46'.$$

2. Express as functions of an angle less than 45° :

$$\sin 60^\circ. \quad \tan 57^\circ. \quad \csc 69^\circ 2'. \quad \cot 89^\circ 59'.$$

$$\cos 75^\circ. \quad \cot 84^\circ. \quad \cos 85^\circ 39'. \quad \csc 45^\circ 1'.$$

3. Given $\tan 30^\circ = \frac{1}{\sqrt{3}}$; find $\cot 60^\circ$.

4. Given $\tan A = \cot A$; find A .

5. Given $\cos A = \sin 2A$; find A .

6. Given $\sin A = \cos 2A$; find A .

7. Given $\cos A = \sin (45^\circ - \frac{1}{2}A)$; find A .

8. Given $\cot \frac{1}{2}A = \tan A$; find A .

9. Given $\tan (45^\circ + A) = \cot A$; find A .

10. Find A if $\sin A = \cos 4A$.

11. Find A if $\cot A = \tan 8A$.

12. Find A if $\cot A = \tan nA$

SECTION VI

RELATIONS OF THE FUNCTIONS OF AN ANGLE

Since (Fig. 6) $a^2 + b^2 = c^2$, therefore,

$$\frac{a^2}{c^2} + \frac{b^2}{c^2} = 1, \text{ or } \left(\frac{a}{c}\right)^2 + \left(\frac{b}{c}\right)^2 = 1.$$

But $\frac{a}{c} = \sin A$, and $\frac{b}{c} = \cos A$;

therefore, $(\sin A)^2 + (\cos A)^2 = 1$;
or, as it is usually written for convenience,

$$\sin^2 A + \cos^2 A = 1. \quad [1]$$

That is: *The sum of the squares of the sine and the cosine of an angle is equal to unity.*

Formula [1] enables us to find the cosine of an angle when the sine is known, and the sine when the cosine is known.

The values of $\sin A$ and of $\cos A$ deduced from [1] are:

$$\sin A = \sqrt{1 - \cos^2 A}, \quad \cos A = \sqrt{1 - \sin^2 A}.$$

Since
$$\frac{a}{c} \div \frac{b}{c} = \frac{a}{c} \times \frac{c}{b} = \frac{a}{b},$$

and since
$$\frac{a}{c} = \sin A, \quad \frac{b}{c} = \cos A, \quad \text{and} \quad \frac{a}{b} = \tan A,$$

therefore,
$$\tan A = \frac{\sin A}{\cos A}. \quad [2]$$

That is: *The tangent of an angle is equal to the sine divided by the cosine.*

Formula [2] enables us to find the tangent of an angle when the sine and the cosine are known.

FIG. 6

Now

$$\frac{a}{c} \times \frac{c}{a} = 1, \quad \frac{b}{c} \times \frac{c}{b} = 1, \quad \frac{a}{b} \times \frac{b}{a} = 1,$$

and

$$\frac{a}{c} = \sin A, \quad \frac{b}{c} = \cos A, \quad \frac{a}{b} = \tan A,$$

$$\frac{b}{a} = \cot A, \quad \frac{c}{b} = \sec A, \quad \frac{c}{a} = \csc A.$$

FIG. 7

Therefore,

$$\left. \begin{aligned} \sin A \times \csc A &= 1 \\ \cos A \times \sec A &= 1 \\ \tan A \times \cot A &= 1 \end{aligned} \right\} \quad [3]$$

That is: *The sine and the cosecant of an angle, the cosine and the secant, and the tangent and the cotangent, pair by pair, are reciprocals.*

The equations in [3] enable us to find an unknown function contained in any pair of these reciprocals when the other function in this pair is known.

$$4. \quad \cot A = \frac{\cos A}{\sin A}.$$

$$7. \quad \cos A \csc A = \cot A.$$

$$5. \quad \sin A \sec A = \tan A.$$

$$8. \quad \tan A \cos A = \sin A.$$

$$6. \quad \sin A \cot A = \cos A.$$

16. $(\sin^2 A - \cos^2 A)^2 = 1 - 4 \sin^2 A \cos^2 A.$
17. $(1 - \tan^2 A)^2 = \sec^4 A - 4 \tan^2 A.$
18. $\frac{\sin A}{\cos A} + \frac{\cos A}{\sin A} = \sec A \csc A.$

21. $\csc A - \sin A = \cos A \cot A.$
22. $\frac{\cos A}{1 - \sin A} = \frac{1 + \sin A}{\cos A}.$

SECTION VII

APPLICATION OF FORMULAS [1], [2], [3]

Formulas [1], [2], and [3] enable us, when any one function of an angle is given, to find all the others. A given value of any one function, therefore, determines all the others.

EXAMPLE 1. Given $\sin A = \frac{2}{3}$; find the other functions.

By [1], p. 13, $\cos A = \sqrt{1 - \frac{4}{9}} = \sqrt{\frac{5}{9}} = \frac{1}{3} \sqrt{5}.$

By [2], p. 13, $\tan A = \frac{2}{3} \div \frac{1}{3} \sqrt{5} = \frac{2}{3} \times \frac{3}{\sqrt{5}} = \frac{2}{\sqrt{5}} = \frac{2}{5} \sqrt{5}$

By [3], p. 14, $\cot A = \frac{1}{2} \sqrt{5}, \sec A = \frac{3}{2} \sqrt{5}, \csc A = \frac{3}{2}.$

EXAMPLE 2. Given $\tan A = 3$; find the other functions.

By [2], p. 13,
$$\frac{\sin A}{\cos A} = 3.$$

And by [1], p. 13,

$$\sin^2 A + \cos^2 A = 1.$$

If we solve these equations (regarding $\sin A$ and $\cos A$ as two unknown quantities), we find

$$\sin A = \frac{3}{10} \sqrt{10}, \quad \cos A = \frac{1}{10} \sqrt{10}.$$

Then, by [3], p. 14, $\cot A = \frac{1}{3}, \sec A = \sqrt{10}, \csc A = \frac{1}{3} \sqrt{10}.$

EXAMPLE 3. Given $\sec A = m$; find the other functions.

By [3], p. 14, $\cos A = \frac{1}{m}.$

By [1], p. 13, $\sin A = \sqrt{1 - \frac{1}{m^2}} = \sqrt{\frac{m^2 - 1}{m^2}} = \frac{1}{m} \sqrt{m^2 - 1}.$

By [2], p. 13, $\tan A = \sqrt{m^2 - 1}.$

By [3], p. 14,

$$\cot A = \frac{1}{\sqrt{m^2 - 1}} \sqrt{m^2 - 1}; \quad \csc A = \frac{m}{\sqrt{m^2 - 1}} \sqrt{m^2 - 1}.$$

EXERCISE VI

Find the values of the other functions, when :

1. $\sin A = \frac{1}{3}.$ 5. $\tan A = \frac{4}{3}.$ 9. $\csc A = \sqrt{2}.$

2. $\sin A = 0.8.$ 6. $\cot A = 1.$ 10. $\sin A = m.$

3. $\cos A = \frac{5}{13}.$ 7. $\cot A = 0.5.$ 11. $\sin A = \frac{2m}{1+m^2}.$

4. $\cos A = 0.28.$ 8. $\sec A = 2.$ 12. $\cos A = \frac{2mn}{m^2+n^2}.$

13. Given $\tan 45^\circ = 1$; find the other functions of 45° .

14. Given $\sin 30^\circ = \frac{1}{2}$; find the other functions of 30° .

15. Given $\csc 60^\circ = \frac{2}{\sqrt{3}}$; find the other functions of 60° .
 16. Given $\tan 15^\circ = 2 - \sqrt{3}$; find the other functions of 15° .
 17. Given $\cot 22^\circ 30' = \sqrt{2} + 1$; find the other functions of $22^\circ 30'$.

18. Given $\sin 0^\circ = 0$; find the other functions of 0° .
 19. Given $\sin 90^\circ = 1$; find the other functions of 90° .
 20. Given $\tan 90^\circ = \infty$; find the other functions of 90° .

Express the values of all the other functions in terms of:

21. $\sin A$. 22. $\cos A$. 23. $\tan A$. 24. $\cot A$.
 25. Given $2 \sin A = \cos A$; find $\sin A$ and $\cos A$.
 26. Given $4 \sin A = \tan A$; find $\sin A$ and $\tan A$.
 27. If $\sin A : \cos A = 9 : 40$, find $\sin A$ and $\cos A$.
 28. Transform the quantity $\tan^2 A + \cot^2 A - \sin^2 A - \cos^2 A$ into a form containing only $\cos A$.
 29. Prove that $\sin A + \cos A = (1 + \tan A) \cos A$.
 30. Prove that $\tan A + \cot A = \sec A \times \csc A$.

SECTION VIII

FUNCTIONS OF 45°

Let ACB (Fig. 8) be an isosceles right triangle, in which the length of the hypotenuse AB is equal to 1; then AC is equal to BC , and the angle A is equal to 45° . Since $\overline{AC}^2 + \overline{BC}^2 = 1$, therefore $2\overline{AC}^2 = 1$, and $AC = \sqrt{\frac{1}{2}} = \frac{1}{2}\sqrt{2}$.

Therefore, by Sect. II, p. 5,

$$\sin 45^\circ = \cos 45^\circ = \frac{1}{2}\sqrt{2};$$

$$\tan 45^\circ = \cot 45^\circ = 1;$$

$$\sec 45^\circ = \csc 45^\circ = \sqrt{2}.$$

FIG. 8

SECTION IX

FUNCTIONS OF 30° AND 60°

Let ABC (Fig. 9) be an equilateral triangle, in which the length of each side is equal to 1; and let CD bisect the angle C . Then CD is perpendicular to AB and bisects AB .

Hence, $AD = \frac{1}{2}$, and $CD = \sqrt{1 - \frac{1}{4}} = \sqrt{\frac{3}{4}} = \frac{1}{2}\sqrt{3}$.

In the right triangle ADC , the angle $ACD = 30^\circ$, and the angle $CAD = 60^\circ$. Whence, by Sect. II, p. 5,

FIG. 9

$$\sin 30^\circ = \cos 60^\circ = \frac{1}{2};$$

$$\cos 30^\circ = \sin 60^\circ = \frac{1}{2}\sqrt{3};$$

$$\tan 30^\circ = \cot 60^\circ = \frac{1}{\sqrt{3}} = \frac{1}{3}\sqrt{3};$$

$$\cot 30^\circ = \tan 60^\circ = \sqrt{3};$$

$$\sec 30^\circ = \csc 60^\circ = \frac{2}{\sqrt{3}} = \frac{2}{3}\sqrt{3};$$

$$\csc 30^\circ = \sec 60^\circ = 2.$$

The results for sine and cosine of 30° , 45° , and 60° may be easily remembered by arranging them in the following form:

| Angle | 30° | 45° | 60° | $\frac{1}{2}\sqrt{1} = 0.5$ |
|--------|-----------------------|-----------------------|-----------------------|---------------------------------|
| Sine | $\frac{1}{2}\sqrt{1}$ | $\frac{1}{2}\sqrt{2}$ | $\frac{1}{2}\sqrt{3}$ | $\frac{1}{2}\sqrt{2} = 0.70711$ |
| Cosine | $\frac{1}{2}\sqrt{3}$ | $\frac{1}{2}\sqrt{2}$ | $\frac{1}{2}\sqrt{1}$ | $\frac{1}{2}\sqrt{3} = 0.86603$ |

EXERCISE VII

Solve the following equations:

1. $2 \cos x = \sec x$.

3. $\tan x = 2 \sin x$.

2. $4 \sin x = \csc x$.

4. $\sec x = \sqrt{2} \tan x$.

5. $\sin^2 x = 3 \cos^2 x$. 9. $\sin^2 x - \cos x = \frac{1}{4}$.
6. $2 \sin^2 x + \cos^2 x = \frac{3}{2}$. 10. $\tan^2 x - \sec x = 1$.
7. $3 \tan^2 x - \sec^2 x = 1$. 11. $\sin x + \sqrt{3} \cos x = 2$.
8. $\tan x + \cot x = 2$. 12. $\tan^2 x + \csc^2 x = 3$.
13. $2 \cos x + \sec x = 3$.
— 14. $\cos^2 x - \sin^2 x = \sin x$.
— 15. $2 \sin x + \cot x = 1 + 2 \cos x$.
— 16. $\sin^2 x + \tan^2 x = 3 \cos^2 x$.
— 17. $\tan x + 2 \cot x = \frac{5}{2} \csc x$.

NOTE. Wentworth & Hill's Five-place Logarithmic and Trigonometric Tables have full explanations, and directions for using them. Before proceeding to Chapter II the student should learn how to use these tables.

Table VI is to be used in solutions *without logarithms*. This four-place table contains the natural functions of angles at intervals of 1'. The decimal point must be inserted before each value given, except when it appears in the values of the table.

CHAPTER II

THE RIGHT TRIANGLE

SECTION X

THE GIVEN PARTS

In order to solve a right triangle, two parts besides the right angle must be given, one of them at least being a side.

The two given parts may be:

- I. An acute angle and the hypotenuse.
- II. An acute angle and the opposite leg.
- III. An acute angle and the adjacent leg.
- IV. The hypotenuse and a leg.
- V. The two legs.

SECTION XI

$$\begin{array}{r} \sin A = 0.6856 \\ c = \frac{26}{41136} \\ \frac{13712}{17.8256} \\ a = 17.8256 \end{array}$$

$$\begin{array}{r} \cos A = 0.7280 \\ c = \frac{26}{43680} \\ \frac{14560}{18.9280} \\ b = 18.9280 \end{array}$$

CASE II

$$a^2 = 1600$$

$$b^2 = 729$$

$$c^2 = 2329$$

$$\therefore c = \sqrt{2329}$$

$$= 48.26$$

SECTION XII

GENERAL METHOD OF SOLVING THE RIGHT TRIANGLE

From these five cases it appears that the general method of finding an unknown part in a right triangle is as follows:

Choose from the equation $A + B = 90^\circ$, and the equations that define the functions of the angles, an equation in which the required part only is unknown; solve this equation, if necessary, to find the value of the unknown part; then compute the value.

NOTE. In Case IV, if the given sides (here a and c) are nearly alike in value, then A is near 90° , and its value cannot be accurately found from the tables, because the sines of large angles differ little in value (as is evident from Fig. 4). In this case it is better to find B first, by means of the formula given on page 59, namely,

$$\tan \frac{1}{2} B = \sqrt{\frac{c-a}{c+a}}.$$

EXAMPLE. Given $a = 49$, $c = 50$; find A , B , b .

$$c - a = 1, c + a = 99.$$

$$\frac{c-a}{c+a} = 0.01010$$

$$\sqrt{\frac{c-a}{c+a}} = 0.1005$$

$$\tan \frac{1}{2} B = 0.1005$$

$$\therefore \frac{1}{2} B = 5^\circ 44'$$

$$B = 11^\circ 28'$$

$$A = 78^\circ 32'$$

$$c - a = 1$$

$$c + a = 99$$

$$c^2 - a^2 = 99$$

$$b^2 = 99$$

$$b = \sqrt{99}$$

$$= 9.95$$

NOTE. In Cases IV and V the unknown side may also be found from the equations

$$(\text{for Case IV}) \quad b = \sqrt{c^2 - a^2} = \sqrt{(c + a)(c - a)};$$

$$(\text{for Case V}) \quad c = \sqrt{a^2 + b^2}.$$

These equations express the values of b and c directly in terms of the two given sides; and if the values of the sides are simple numbers (e.g., 5, 12, 13), it is often easier to find b or c in this way. But this value of c is not adapted to logarithms, and this value of b is not so readily found by logarithms as the value of b given under Case IV. See also p. 23.

SECTION XIV

AREA OF THE RIGHT TRIANGLE

The area of a triangle is equal to one-half the product of the base by the altitude; therefore, if a and b denote the legs of a right triangle, and F the area, $F = \frac{1}{2}ab$.

Hence, the area may be found when a and b are known.

For example: Find the area, having given:

CASE I (Sect. XIII, p. 25).

$$A = 34^\circ 28', c = 18.75.$$

First find (as in Sect. XIII, p. 25) $\log a$ and $\log b$.

$$\log F = \log a + \log b + \text{colog } 2$$

$$\log a = 1.02576$$

$$\log b = 1.18917$$

$$\text{colog } 2 = 9.69897 - 10$$

$$\log F = 1.91390$$

$$F = 82.016$$

CASE IV (Sect. XIII, p. 26).

$$a = 47.55, c = 58.40.$$

First find (as in Sect. XIII, p. 26) $\log a$ and $\log b$.

$$\log F = \log a + \log b + \text{colog } 2$$

$$\log a = 1.67715$$

$$\log b = 1.53015$$

$$\text{colog } 2 = 9.69897 - 10$$

$$\log F = 2.90627$$

$$F = 805.88$$

SECTION XV

THE ISOSCELES TRIANGLE

An isosceles triangle is divided by the perpendicular from the vertex to the base into two *equal right triangles*.

Therefore, an isosceles triangle is determined by any two parts that determine one of these right triangles.

FIG. 21

Let the parts of an isosceles triangle CAB (Fig. 21), among which the altitude CD is to be included, be denoted as follows:

a = one of the equal sides,

c = the base,

h = the altitude,

A = one of the equal angles,

C = the angle at the vertex.

For example: Given a and c ; required A , C , h .

$$1. \cos A = \frac{\frac{1}{2}c}{a} = \frac{c}{2a}.$$

$$2. C + 2A = 180^\circ; \therefore C = 180^\circ - 2A = 2(90^\circ - A).$$

3. h may be found by any one of the equations:

$$h^2 + \frac{c^2}{4} = a^2;$$

whence

$$h = \sqrt{(a + \frac{1}{2}c)(a - \frac{1}{2}c)}.$$

Also,

$$\frac{h}{a} = \sin A, \quad \text{and} \quad \frac{h}{\frac{1}{2}c} = \tan A;$$

whence

$$h = a \sin A, \quad \text{and} \quad h = \frac{1}{2}c \tan A.$$

When c and h are known, the area can be found by the formula

$$F = \frac{1}{2}ch.$$

SECTION XVI

THE REGULAR POLYGON

Lines drawn from the centre of a regular polygon (Fig. 22) to the vertices are radii of the circumscribed circle; and lines drawn from the centre to the middle points of the sides are radii of the inscribed circle. These lines divide the polygon into *equal right triangles*. Therefore, a regular polygon is determined by a right triangle whose sides are the radius of the circumscribed circle, the radius of the inscribed circle, and half of one side of the polygon.

If the polygon has n sides, the angle of this right triangle at the centre of the polygon is equal to $\frac{1}{2}\left(\frac{360^\circ}{n}\right)$, or $\frac{180^\circ}{n}$; and the triangle may be solved when a side of the polygon or one of the radii is given.

CHAPTER III

GONIOMETRY

SECTION XVII

DEFINITION OF GONIOMETRY

To prepare the way for the solution of the oblique triangle, we now proceed to extend the definitions of the trigonometric functions to angles of all magnitudes, and to deduce certain useful relations of the functions of different angles.

That branch of Trigonometry which treats of trigonometric functions in general, and of their relations, is called **Goniometry**.

SECTION XVIII

POSITIVE AND NEGATIVE QUANTITIES

In measurements it is convenient to mark the distinction between two magnitudes that are measured in *opposite directions*, by calling one of them **positive** and the other **negative**.

FIG. 23

Thus, if OX (Fig. 23) is considered to be positive, then OX' is considered to be negative; and if OY is considered to be positive, then OY' is considered to be negative.

When this distinction is applied to angles, an angle is considered to be *positive*, if the rotating line that describes it moves counter-clockwise, that is, in the direction opposite

to the hands of a clock, and to be *negative*, if the rotating line moves clockwise, that is, in the same direction as the hands of a clock.

Arcs corresponding to positive angles are considered *positive*, and arcs corresponding to negative angles are considered *negative*.

Thus, the angle AOB (Fig. 24) described by a line rotating about O from OA to OB is positive, and the arc AB is positive; the angle AOB' described by the line rotating about O from OA to OB' is negative, and the arc AB' is negative.

FIG. 24

SECTION XIX

CO-ORDINATES OF A POINT IN A PLANE

Let XX' (Fig. 25) be a horizontal line and let YY' be a line

FIG. 25

perpendicular to XX' at the point O . Then the plane determined by the lines XX' and YY' is divided into four quadrants which are numbered I, II, III, IV.

Any point in the plane is determined by its *distance* and *direction* from each of the perpendiculars XX' and YY' . Its distance from YY' , measured on XX' , is called the *abscissa* of the point; its distance from XX' , measured on YY' , is called the *ordinate* of the point.

The abscissa and the ordinate of a point are called the *co-ordinates* of the point; and the lines XX' and YY' are called the *axes of co-ordinates*. XX' is called the *axis of abscissas* or the *axis of x*; YY' is called the *axis of ordinates* or the *axis of y*; and the point O is called the *origin*.

FIG. 26

In Fig. 26 the co-ordinates P_1, P_2, P_3, P_4 are as follows :

The abscissa of P_1 is OB_1 ,
 and the ordinate of P_1 is OA_1 ;
 the abscissa of P_2 is OB_2 ,
 and the ordinate of P_2 is OA_2 ;
 the abscissa of P_3 is OB_3 ,
 and the ordinate of P_3 is OA_3 ;
 the abscissa of P_4 is OB_4 ,
 and the ordinate of P_4 is OA_4 .

Abscissas to the *right* of YY' are **positive**.

Abscissas to the *left* of YY' are **negative**.

Ordinates *above* XX' are **positive**.

Ordinates *below* XX' are **negative**.

Therefore,

in Quadrant I,

the abscissa is positive, the ordinate is positive;

in Quadrant II,

the abscissa is negative, the ordinate is positive;

in Quadrant III,

the abscissa is negative, the ordinate is negative;

in Quadrant IV,

the abscissa is positive, the ordinate is negative.

SECTION XX

ANGLES OF ANY MAGNITUDE

If the line OP (Figs. 27–30) is revolved about O from OX as its **initial position** counter-clockwise, as shown by the curved arrows, the line during one revolution will form with OX all angles from 0° to 360° .

Any particular angle is said to be an angle of that quadrant in which its **terminal side** lies.

FIG. 27

FIG. 28

FIG. 29

FIG. 30

Angles between 0° and 90° are angles of Quadrant I.
 Angles between 90° and 180° are angles of Quadrant II.
 Angles between 180° and 270° are angles of Quadrant III.
 Angles between 270° and 360° are angles of Quadrant IV.

FIG. 31

FIG. 32

FIG. 33

FIG. 34

If the revolving line makes another revolution (Figs. 31–34), it will describe all angles from 360° to 720° ; and so on.

FIG. 35

FIG. 36

FIG. 37

FIG. 38

If the line OP is revolved from OX clockwise (Figs. 35–38), it will describe all *negative* angles.

Thus we arrive at the conception of an angle of any magnitude, positive or negative.

SECTION XXI

FUNCTIONS OF ANY ANGLE

Figs. 39–42 show the functions in a unit circle drawn for an angle AOP in each quadrant, taken in order. The tangents to the circle are *always* drawn through A and B .

Let the angle AOP formed with OA by the moving radius OP be denoted by x ; then, in each quadrant,

$$\sin x = MP, \quad \tan x = AT, \quad \sec x = OT,$$

$$\cos x = OM, \quad \cot x = BS, \quad \csc x = OS.$$

FIG. 39

FIG. 40

FIG. 41

FIG. 42

If the terminal line of any angle x extends through the vertex indefinitely both ways, and if the circumference of a unit circle cuts the terminal line at P , the axis of abscissas at A , and the axis of ordinates at B , then

$\sin x$ = the ordinate of P ;

$\cos x$ = the abscissa of P ;

$\tan x$ = the tangent from A to meet the terminal line ;

$\cot x$ = the tangent from B to meet the terminal line ;

$\sec x$ = the segment of the terminal line between the vertex
and the tangent ;

$\csc x$ = the segment of the terminal line between the vertex
and the cotangent.

Sines and tangents extending from the axis of abscissas upwards are positive; downwards, negative.

Cosines and cotangents extending from the axis of ordinates towards the right are positive; towards the left, negative.

The signs of the secant and cosecant are determined by the signs of the cosine and sine, respectively. Therefore, secants and cosecants extending from the centre, in the direction of the terminal line, are considered positive; in the opposite direction, negative. Hence,

| QUADRANT | I | II | III | IV |
|-------------------|---|----|-----|----|
| \sin and \csc | + | + | - | - |
| \cos and \sec | + | - | - | + |
| \tan and \cot | + | - | + | - |

In Quadrant I all the functions are positive.

In Quadrant II the *sine and cosecant only* are positive.

In Quadrant III the *tangent and cotangent only* are positive.

In Quadrant IV the *cosine and secant only* are positive.

The signs of all the functions of any quadrant are known when the signs of the sine and cosine are known.

If the sine and cosine have like signs, the tangent and cotangent are positive; if unlike signs, negative. The sine and cosecant have like signs; the cosine and secant have like signs.

SECTION XXII

FUNCTIONS OF A VARIABLE ANGLE

Let the angle AOP (Fig. 43) increase continuously from 0° to 360° . The values of its functions change as follows:

FIG. 43

1. *The Sine.* In the first quadrant the sine MP increases from 0 to 1; in the second it remains positive, and decreases from 1 to 0; in the third it is negative, and increases in absolute value from 0 to 1; in the fourth it is negative, and decreases in absolute value from 1 to 0.

2. *The Cosine.* In the first quadrant the cosine OM decreases from 1 to 0; in the second it becomes negative, and increases in absolute value from 0 to 1; in the third it is negative, and decreases in absolute value from 1 to 0;

in the fourth it is positive, and increases from 0 to 1.

3. *The Tangent.* In the first quadrant the tangent AT increases from 0 to ∞ ; in the second it becomes negative, and decreases in absolute value from ∞ to 0; in the third it is positive, and increases from 0 to ∞ ; in the fourth it is negative, and decreases in absolute value from ∞ to 0.

4. *The Cotangent.* In the first quadrant, the cotangent BS decreases from ∞ to 0; in the second it is negative, and increases in absolute value from 0 to ∞ ; in the third and fourth quadrants, it has the same sign, and undergoes the same changes as in the first and second quadrants, respectively.

5. *The Secant.* In the first quadrant, the secant OT increases from 1 to ∞ ; in the second it is negative, and decreases in absolute value from ∞ to 1; in the third it is negative, and increases in absolute value from 1 to ∞ ; in the fourth it is positive, and decreases from ∞ to 1.

6. *The Cosecant.* In the first quadrant, the cosecant OS decreases from ∞ to 1; in the second it is positive, and increases from 1 to ∞ ; in the third it is negative, and decreases in absolute value from ∞ to 1; in the fourth it is negative, and increases in absolute value from 1 to ∞ .

The limiting values of the functions are as follows:

| | 0° | 90° | 180° | 270° | 360° |
|-----------|--------------|--------------|--------------|--------------|--------------|
| Sine | ± 0 | +1 | ± 0 | -1 | ± 0 |
| Cosine | +1 | ± 0 | -1 | ± 0 | +1 |
| Tangent | ± 0 | $\pm \infty$ | ± 0 | $\pm \infty$ | ± 0 |
| Cotangent | $\pm \infty$ | ± 0 | $\pm \infty$ | ± 0 | $\pm \infty$ |
| Secant | +1 | $\pm \infty$ | -1 | $\pm \infty$ | +1 |
| Cosecant | $\pm \infty$ | +1 | $\pm \infty$ | -1 | $\pm \infty$ |

Sines and cosines vary in value from +1 to -1; tangents and cotangents, from + ∞ to - ∞ ; secants and cosecants, from + ∞ to +1, and from -1 to - ∞ .

In the table given above the double sign \pm is placed before 0 and ∞ . From the preceding investigation it appears that the functions *always change sign in passing through 0 and ∞* ; and the sign + or - prefixed to 0 or ∞ simply shows the direction from which the value is reached.

SECTION XXIII

FUNCTIONS OF ANGLES LARGER THAN 360°

The functions of $360^\circ + x$ are the same in sign and in absolute value as those of x ; for the moving radius has the same position in both cases. If n is a positive integer,

The functions of $(n \times 360^\circ + x)$ are the same as those of x .

For example: The functions of $2200^\circ (6 \times 360^\circ + 40^\circ)$ are equal to the functions of 40° .

SECTION XXIV

EXTENSION OF FORMULAS

The Formulas [1], [2], [3] established for *acute* angles on pp. 13, 14 hold true for *all* angles. Thus, in each quadrant

$$\overline{MP}^2 + \overline{OM}^2 = \overline{OP}^2.$$

Therefore,

$$\sin^2 x + \cos^2 x = 1. \quad [1]$$

We have in each quadrant from the similar triangles OMP , OAT , OBS the proportions

$$AT : OA = MP : OM,$$

$$\text{or } \tan x : 1 = \sin x : \cos x;$$

$$MP : OP = OB : OS,$$

$$\text{or } \sin x : 1 = 1 : \csc x;$$

$$OM : OP = OA : OT,$$

$$\text{or } \cos x : 1 = 1 : \sec x;$$

$$AT : OA = OB : BS,$$

$$\text{or } \tan x : 1 = 1 : \cot x.$$

FIG. 44

That is,
$$\tan x = \frac{\sin x}{\cos x}. \quad [2]$$

$$\left. \begin{aligned} \sin x \times \csc x &= 1 \\ \cos x \times \sec x &= 1 \\ \tan x \times \cot x &= 1 \end{aligned} \right\}. \quad [3]$$

Formulas [1]–[3] enable us, from a given value of one function, to find the *absolute* values of the other five functions, and also the sign of the reciprocal function. But in order to determine the proper signs to be placed before the other four functions, we must know the quadrant to which the angle in question belongs, or the sign of any *one* of these four functions; for, by Sect. XXI, p. 40, it will be seen that *the signs of any two functions that are not reciprocals determine the quadrant to which the angle belongs*.

EXAMPLE. Given $\sin x = +\frac{4}{5}$, and $\tan x$ negative; find the values of the other functions.

Since $\sin x$ is positive, x is an angle in Quadrant I or II; but, since $\tan x$ is negative, Quadrant I is inadmissible.

By [1],
$$\cos x = \pm \sqrt{1 - \frac{16}{25}} = \pm \frac{3}{5}.$$

Since the angle is in Quadrant II, the minus sign must be taken, and we have

$$\cos x = -\frac{3}{5}.$$

By [2] and [3],

$$\tan x = -\frac{4}{3}, \quad \cot x = -\frac{3}{4}, \quad \sec x = -\frac{5}{3}, \quad \csc x = \frac{5}{4}.$$

$$22. a \sin 90^\circ - b \cos 360^\circ + (a - b) \cos 180^\circ.$$

$$23. (a^2 - b^2) \cos 360^\circ - 4ab \sin 270^\circ.$$

SECTION XXV

REDUCTION OF FUNCTIONS TO THE FIRST QUADRANT

In a unit circle (Fig. 45) draw two diameters PR and QS equally inclined to the horizontal diameter AA' , or so that the angles AOP , $A'OQ$, $A'OR$, and AOS shall be equal. From the points P , Q , R , S let fall perpendiculars to AA' ; the four right triangles thus formed, with a common vertex at O , are equal; because they have equal hypotenuses (radii of the circle) and equal acute angles at O . Therefore, the perpendiculars PM , QN , RN , SM are equal, and are the sines of the angles AOP , AOQ , AOR , AOS , respectively.

FIG. 45

Therefore, *in absolute value*,

$$\sin AOP = \sin AOQ = \sin AOR = \sin AOS.$$

And from Sect. XXIV, p. 44, it follows that *in absolute value* the cosines of these angles are also equal; and likewise the tangents, the cotangents, the secants, and the cosecants.*

FIG. 46

Hence, *For every acute angle there is an angle in each of the higher quadrants whose functions, in absolute value, are equal to those of this acute angle.*

Let $\angle AOP = x$, $\angle POB = y$; then $x + y = 90^\circ$, and the functions of x are equal to the co-named functions of y (Sect. V, p. 11); and

$$\angle AOQ \text{ (in Quadrant II)} = 180^\circ - x = 90^\circ + y,$$

$$\angle AOR \text{ (in Quadrant III)} = 180^\circ + x = 270^\circ - y,$$

$$\angle AOS \text{ (in Quadrant IV)} = 360^\circ - x = 270^\circ + y.$$

Hence, prefixing the proper sign (Sect. XXI, p. 40), we have:

ANGLE IN QUADRANT II

$$\sin(180^\circ - x) = \sin x. \quad \sin(90^\circ + y) = \cos y.$$

$$\cos(180^\circ - x) = -\cos x. \quad \cos(90^\circ + y) = -\sin y.$$

$$\tan(180^\circ - x) = -\tan x. \quad \tan(90^\circ + y) = -\cot y.$$

$$\cot(180^\circ - x) = -\cot x. \quad \cot(90^\circ + y) = -\tan y.$$

* In future, secants, cosecants, versed sines, and covered sines will be disregarded. Secants and cosecants may be found by Formula [3], versed sines and covered sines by VII and VIII, p. 5, if wanted, but they are seldom used in computations.

ANGLE IN QUADRANT III

$$\begin{array}{ll}
 \sin (180^{\circ} + x) = -\sin x. & \sin (270^{\circ} - y) = -\cos y. \\
 \cos (180^{\circ} + x) = -\cos x. & \cos (270^{\circ} - y) = -\sin y. \\
 \tan (180^{\circ} + x) = \tan x. & \tan (270^{\circ} - y) = \cot y. \\
 \cot (180^{\circ} + x) = \cot x. & \cot (270^{\circ} - y) = \tan y.
 \end{array}$$

ANGLE IN QUADRANT IV

$$\begin{array}{ll}
 \sin (360^{\circ} - x) = -\sin x. & \sin (270^{\circ} + y) = -\cos y. \\
 \cos (360^{\circ} - x) = \cos x. & \cos (270^{\circ} + y) = \sin y. \\
 \tan (360^{\circ} - x) = -\tan x. & \tan (270^{\circ} + y) = -\cot y. \\
 \cot (360^{\circ} - x) = -\cot x. & \cot (270^{\circ} + y) = -\tan y.
 \end{array}$$

REMARK. The tangents and cotangents may be found directly from the figure, or by Formula [2].

It is evident, from these formulas,

1. *The functions of all angles can be reduced to the functions of angles in the first quadrant, and therefore to functions of angles not greater than 45° (Sect. V, p. 11).*

2. *If an acute angle is added to or subtracted from 180° or 360° , the functions of the resulting angle are equal in absolute value to the like-named functions of the acute angle; but if an acute angle is added to or subtracted from 90° or 270° , the functions of the resulting angle are equal in absolute value to the co-named functions of the acute angle.*

3. *A given value of a sine or cosecant determines two supplementary angles, one acute, the other obtuse; a given value of any other function determines only one angle: acute if the value is positive, obtuse if the value is negative. [See functions of $(180^{\circ} - x)$.]*

SECTION XXVI

FUNCTIONS OF ANGLES THAT DIFFER BY 90°

The general form of two angles whose difference is 90° is x and $90^\circ + x$, and they must lie in adjoining quadrants. The relations between their functions were found in Sect. XXV, p. 48, but only for the case when x is acute. These relations, however, may be shown to hold true for all values of x .

FIG. 47

In a unit circle (Fig. 47) draw two diameters PR and QS perpendicular to each other, and let fall to AA' the perpendiculars PM , QH , RK , and SN . The right triangles OMP , QHO , OKR , and SNO are equal, because they have equal hypotenuses and equal acute angles POM , OQH , ROK , and OSN .

Therefore, $OM = QH = OK = NS$,
and $PM = OH = RK = ON$.

Hence, taking into account the algebraic sign,

$$\begin{aligned}\sin AOQ &= \cos AOP; & \sin AOS &= \cos AOR; \\ \cos AOQ &= -\sin AOP; & \cos AOS &= -\sin AOR; \\ \sin AOR &= \cos AOQ; & \sin (360^\circ + AOP) &= \cos AOS; \\ \cos AOR &= -\sin AOQ; & \cos (360^\circ + AOP) &= -\sin AOS.\end{aligned}$$

In all these equations, if x denotes the angle on the right-hand side, the angle on the left-hand side is $90^\circ + x$.

Therefore, if x is an angle in any one of the four quadrants,

$$\begin{aligned}\sin (90^\circ + x) &= \cos x, & \tan (90^\circ + x) &= -\cot x. \\ \cos (90^\circ + x) &= -\sin x, & \cot (90^\circ + x) &= -\tan x.\end{aligned}$$

In like manner, it can be shown that all the formulas of Sect. XXV, p. 48, hold true, whatever the values of x and y .

Hence, *In every case the algebraic sign of the function of the resulting angle is the same as when x and y are both acute.*

SECTION XXVII

FUNCTIONS OF A NEGATIVE ANGLE

If the angle x is generated by the radius moving from the initial position OA to the terminal position OS , it will have the sign $-$, and its terminal side will be identical with its position for the angle $360^\circ - x$. Therefore, the functions of the angle $-x$ are the same as those of the angle $360^\circ - x$; or (Sect. XXV, p. 49),

$$\sin(-x) = -\sin x,$$

$$\cos(-x) = \cos x,$$

$$\tan(-x) = -\tan x,$$

$$\cot(-x) = -\cot x.$$

SECTION XXVIII

FUNCTIONS OF THE SUM OF TWO ANGLES

In a unit circle (Fig. 49) let the angle $AOB = x$, the angle $BOC = y$; then the angle $AOC = x + y$.

In order to express $\sin(x + y)$ and $\cos(x + y)$ in terms of the sines and cosines of x and y , draw $CF \perp OA$, $CD \perp OB$, $DE \perp OA$, $DG \perp CF$; then $CD = \sin y$, $OD = \cos y$, and the angle $DCG = x$. Also,

$$\sin(x + y) = CF = DE + CG.$$

FIG. 49

Now $\frac{DE}{OD} = \sin x$; hence, $DE = \sin x \times OD = \sin x \cos y$.

And $\frac{CG}{CD} = \cos x$; hence,

$$CG = \cos x \times CD = \cos x \sin y.$$

Therefore,

$$\sin(x+y) = \sin x \cos y + \cos x \sin y. \quad [4]$$

Again,

$$\cos(x+y) = OF = OE - DG$$

$$\frac{OE}{OD} = \cos x; \text{ hence,}$$

$$OE = \cos x \times OD = \cos x \cos y.$$

$$\frac{DG}{CD} = \sin x; \text{ hence, } DG = \sin x \times CD = \sin x \sin y.$$

$$\text{Therefore, } \cos(x+y) = \cos x \cos y - \sin x \sin y. \quad [5]$$

In this proof x and y , and also the sum $x+y$, are assumed to be acute angles. If the sum $x+y$ of the acute angles x and y is obtuse, as in Fig. 51, the proof remains, word for word, the same as above, the only difference being that the sign of OF will be negative, as DG is now greater than OE . The above formulas, therefore, hold true for all acute angles x and y .

If these formulas hold true for any two acute angles x and y , they hold true when one of the angles is increased by 90° . Thus, if for x we write $x' = 90^\circ + x$, then, by Sect. XXV, p. 48,

$$\sin(x' + y) = \sin(90^\circ + x + y) = \cos(x + y),$$

$$\cos(x' + y) = \cos(90^\circ + x + y) = -\sin(x + y).$$

FIG. 50

FIG. 51

Hence, by [5], $\sin(x' + y) = \cos x \cos y - \sin x \sin y$,
 by [4], $\cos(x' + y) = -\sin x \cos y - \cos x \sin y$.

Now, by Sect. XXV, p. 48,

$$\begin{aligned}\cos x &= \sin(90^\circ + x) = \sin x', \\ \sin x &= -\cos(90^\circ + x) = -\cos x' .\end{aligned}$$

Substitute these values of $\cos x$ and $\sin x$, then

$$\begin{aligned}\sin(x' + y) &= \sin x' \cos y + \cos x' \sin y, \\ \cos(x' + y) &= \cos x' \cos y - \sin x' \sin y .\end{aligned}$$

It follows that Formulas [4] and [5] hold true if either angle is repeatedly increased by 90° ; therefore they apply to all angles whatever.

By Sect. XXIV, p. 45, Formula [2],

$$\tan(x + y) = \frac{\sin(x + y)}{\cos(x + y)} = \frac{\sin x \cos y + \cos x \sin y}{\cos x \cos y - \sin x \sin y} .$$

If we divide each term of the numerator and denominator of the last fraction by $\cos x \cos y$, we have

$$\tan(x + y) = \frac{\frac{\sin x}{\cos x} + \frac{\sin y}{\cos y}}{1 - \frac{\sin x \sin y}{\cos x \cos y}} .$$

$$\text{That is,} \quad \tan(x + y) = \frac{\tan x + \tan y}{1 - \tan x \tan y} . \quad [6]$$

$$\text{Also, } \cot(x + y) = \frac{\cos(x + y)}{\sin(x + y)} = \frac{\cos x \cos y - \sin x \sin y}{\sin x \cos y + \cos x \sin y} .$$

Divide each term of the numerator and denominator by $\sin x \sin y$, remembering that $\frac{\cos x}{\sin x} = \cot x$ and $\frac{\cos y}{\sin y} = \cot y$; we have

$$\cot(x + y) = \frac{\cot x \cot y - 1}{\cot y + \cot x} . \quad [7]$$

SECTION XXIX

FUNCTIONS OF THE DIFFERENCE OF TWO ANGLES

In a unit circle (Fig. 52) let the angle $AOB = x$, $COB = y$; then the angle $AOC = x - y$.

FIG. 52

In order to express $\sin(x - y)$ and $\cos(x - y)$ in terms of the sines and cosines of x and y , draw $CF \perp OA$, $CD \perp OB$, $DE \perp OA$, $DG \perp FC$ prolonged; then $CD = \sin y$, $OD = \cos y$, and the angle $DCG = x$.

Now $\sin(x - y) = CF = DE - CG$.

$$\frac{DE}{OD} = \sin x; \text{ hence, } DE = \sin x \times OD = \sin x \cos y.$$

$$\frac{CG}{CD} = \cos x; \text{ hence, } CG = \cos x \times CD = \cos x \sin y.$$

$$\text{Therefore, } \sin(x - y) = \sin x \cos y - \cos x \sin y. \quad [8]$$

$$\text{Again, } \cos(x - y) = OF = OE + DG.$$

$$\frac{OE}{OD} = \cos x; \text{ hence, } OE = \cos x \times OD = \cos x \cos y.$$

$$\frac{DG}{CD} = \sin x; \text{ hence, } DG = \sin x \times CD = \sin x \sin y.$$

$$\text{Therefore, } \cos(x - y) = \cos x \cos y + \sin x \sin y. \quad [9]$$

In this proof, both x and y are assumed to be acute angles; but, whatever be the values of x and y , the same method of proof will always lead to Formulas [8] and [9], when due regard is paid to the algebraic signs.

The general application of these formulas may be at once shown by deducing them from the general formulas established in Sect. XXVIII, p. 54, as follows:

It is obvious that $(x - y) + y = x$. If we apply Formulas [4] and [5] to $(x - y) + y$, then

$$\sin \{(x - y) + y\} \text{ or } \sin x = \sin (x - y) \cos y + \cos (x - y) \sin y,$$

$$\cos \{(x - y) + y\} \text{ or } \cos x = \cos (x - y) \cos y - \sin (x - y) \sin y.$$

Multiply the first equation by $\cos y$, the second by $\sin y$,

$$\sin x \cos y = \sin (x - y) \cos^2 y + \cos (x - y) \sin y \cos y,$$

$$\cos x \sin y = -\sin (x - y) \sin^2 y + \cos (x - y) \sin y \cos y;$$

whence, by subtraction,

$$\sin x \cos y - \cos x \sin y = \sin (x - y) (\sin^2 y + \cos^2 y).$$

$$\text{But } \sin^2 y + \cos^2 y = 1 \text{ (Sect. XXIV, p. 44).}$$

Therefore, by substitution and transposition,

$$\sin (x - y) = \sin x \cos y - \cos x \sin y.$$

Again, if we multiply the first equation by $\sin y$, the second equation by $\cos y$, and add the results, we obtain, by reducing,

$$\cos (x - y) = \cos x \cos y + \sin x \sin y.$$

Therefore, Formulas [8] and [9], like [4] and [5], from which they have been derived, are universally true.

From [8] and [9], by proceeding as in Sect. XXVIII, p. 55, we obtain

$$\tan (x - y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}. \quad [10]$$

$$\cot (x - y) = \frac{\cot x \cot y + 1}{\cot y - \cot x}. \quad [11]$$

Formulas [4]–[11] may be combined as follows:

$$\sin (x \pm y) = \sin x \cos y \pm \cos x \sin y,$$

$$\cos (x \pm y) = \cos x \cos y \mp \sin x \sin y,$$

$$\tan (x \pm y) = \frac{\tan x \pm \tan y}{1 \mp \tan x \tan y},$$

$$\cot (x \pm y) = \frac{\cot x \cot y \mp 1}{\cot y \pm \cot x}.$$

SECTION XXX

FUNCTIONS OF TWICE AN ANGLE

If $y = x$, Formulas [4]–[7] become

$$\sin 2x = 2 \sin x \cos x. \quad [12]$$

$$\cos 2x = \cos^2 x - \sin^2 x. \quad [13]$$

$$\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}. \quad [14]$$

$$\cot 2x = \frac{\cot^2 x - 1}{2 \cot x}. \quad [15]$$

By these formulas the functions of twice an angle may be found when the functions of the angle are given.

SECTION XXXI

FUNCTIONS OF HALF AN ANGLE

$$\text{Formula [1] is } \cos^2 x + \sin^2 x = 1.$$

$$\text{Formula [13] is } \cos^2 x - \sin^2 x = \cos 2x.$$

$$\text{Subtract, } \frac{2 \sin^2 x = 1 - \cos 2x.}{2 \cos^2 x = 1 + \cos 2x.}$$

$$\text{Add, } 2 \cos^2 x = 1 + \cos 2x.$$

Whence,

$$\sin x = \pm \sqrt{\frac{1 - \cos 2x}{2}}, \quad \cos x = \pm \sqrt{\frac{1 + \cos 2x}{2}}.$$

These values, if z is put for $2x$, and hence $\frac{1}{2}z$ for x , become

$$\sin \frac{1}{2}z = \pm \sqrt{\frac{1 - \cos z}{2}}. \quad [16]$$

$$\cos \frac{1}{2}z = \pm \sqrt{\frac{1 + \cos z}{2}}. \quad [17]$$

Hence, by division (Sect. XXIV, p. 45),

$$\tan \frac{1}{2} z = \pm \sqrt{\frac{1 - \cos z}{1 + \cos z}}. \quad [18]$$

$$\cot \frac{1}{2} z = \pm \sqrt{\frac{1 + \cos z}{1 - \cos z}}. \quad [19]$$

By these formulas the functions of half an angle may be computed when the cosine of the entire angle is given.

The proper sign to be placed before the root in each case depends on the quadrant in which the angle $\frac{1}{2} z$ lies (Sect. XXII, p. 42).

Let the student show from Formula [18] that

$$\tan \frac{1}{2} B = \sqrt{\frac{c - a}{c + a}}. \quad (\text{See p. 23, Note.})$$

SECTION XXXII

SUMS AND DIFFERENCES OF FUNCTIONS

From [4], [5], [8], and [9], by addition and subtraction,

$$\sin(x + y) + \sin(x - y) = 2 \sin x \cos y,$$

$$\sin(x + y) - \sin(x - y) = 2 \cos x \sin y,$$

$$\cos(x + y) + \cos(x - y) = 2 \cos x \cos y,$$

$$\cos(x + y) - \cos(x - y) = -2 \sin x \sin y;$$

or, by making $x + y = A$, and $x - y = B$, and, therefore, $x = \frac{1}{2}(A + B)$, and $y = \frac{1}{2}(A - B)$,

$$\sin A + \sin B = 2 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}(A - B). \quad [20]$$

$$\sin A - \sin B = 2 \cos \frac{1}{2}(A + B) \sin \frac{1}{2}(A - B). \quad [21]$$

$$\cos A + \cos B = 2 \cos \frac{1}{2}(A + B) \cos \frac{1}{2}(A - B). \quad [22]$$

$$\cos A - \cos B = -2 \sin \frac{1}{2}(A + B) \sin \frac{1}{2}(A - B). \quad [23]$$

From [20] and [21], by division, we obtain

$$\frac{\sin A + \sin B}{\sin A - \sin B} = \tan \frac{1}{2}(A + B) \cot \frac{1}{2}(A - B);$$

or, since $\cot \frac{1}{2}(A - B) = \frac{1}{\tan \frac{1}{2}(A - B)},$

$$\frac{\sin A + \sin B}{\sin A - \sin B} = \frac{\tan \frac{1}{2}(A + B)}{\tan \frac{1}{2}(A - B)}. \quad [24]$$

$$31. \sin \frac{1}{2}x \pm \cos \frac{1}{2}x = \sqrt{1 \pm \sin x}.$$

$$32. \frac{\tan x \pm \tan y}{\cot x \pm \cot y} = \pm \tan x \tan y.$$

$$33. \tan (45^\circ - x) = \frac{1 - \tan x}{1 + \tan x}.$$

$$36. \tan A + \tan B + \tan C = \tan A \times \tan B \times \tan C.$$

$$37. \cot \frac{1}{2}A + \cot \frac{1}{2}B + \cot \frac{1}{2}C = \cot \frac{1}{2}A \times \cot \frac{1}{2}B \times \cot \frac{1}{2}C.$$

Change to a form more convenient for logarithmic computation:

$$46. \cot x \cot y - 1.$$

$$42. \frac{1 - \cos 2x}{1 + \cos 2x}.$$

$$47. \frac{\tan x + \tan y}{\cot x + \cot y}.$$

SECTION XXXIII

ANTI-TRIGONOMETRIC FUNCTIONS

If y is any trigonometric function of an angle x , then x is said to be the corresponding *anti-trigonometric* function of y .

Thus, if $y = \sin x$, x is the *anti-sine* or *inverse sine* of y .

The anti-trigonometric functions of y are written

$$\begin{array}{llll} \sin^{-1}y, & \tan^{-1}y, & \sec^{-1}y, & \text{vers}^{-1}y, \\ \cos^{-1}y, & \cot^{-1}y, & \csc^{-1}y, & \text{covers}^{-1}y. \end{array}$$

These are read, the angle whose sine is y , and so on.

For example, $\sin 30^\circ = \frac{1}{2}$; hence, $30^\circ = \sin^{-1}\frac{1}{2}$. Similarly, $90^\circ = \cos^{-1}0 = \sin^{-1}1$, and $45^\circ = \tan^{-1}1 = \sin^{-1}\frac{1}{\sqrt{2}}$, etc.

The symbol $^{-1}$ must not be confused with the exponent -1 . Thus, $\sin^{-1}x$ is a very different expression from $\frac{1}{\sin x}$, which would be written $(\sin x)^{-1}$. On the continent of Europe mathematical writers employ the notation *arc sin*, *arc cos*, etc., for \sin^{-1} , \cos^{-1} , etc.

There is an important difference between the trigonometric and the anti-trigonometric functions. When an angle is given, its functions are all completely determined; but when one of the functions is given, the angle may have any one of an indefinite number of values. Thus, if $\sin y = \frac{1}{2}$, y may be 30° , or 150° , or either of these increased or diminished by any integral multiple of 360° or 2π , but cannot take any other values. Accordingly, $\sin^{-1}\frac{1}{2} = 30^\circ \pm 2n\pi$, or $150^\circ \pm 2n\pi$, where n is any positive integer. Similarly, $\tan^{-1}1 = 45^\circ \pm 2n\pi$ or $225^\circ \pm 2n\pi$; i.e., $\tan^{-1}1 = 45^\circ \pm n\pi$.

Since one of the angles whose sine is x and one of the angles whose cosine is x together make 90° , and since similar relations hold for the tangent and cotangent, for the secant and cosecant, and for the versed sine and covered sine, we have

$$\begin{aligned} \sin^{-1}x + \cos^{-1}x &= \frac{\pi}{2}, & \sec^{-1}x + \csc^{-1}x &= \frac{\pi}{2}, \\ \tan^{-1}x + \cot^{-1}x &= \frac{\pi}{2}, & \text{vers}^{-1}x + \text{covers}^{-1}x &= \frac{\pi}{2}, \end{aligned}$$

where it must be understood that each equation is true only for a particular choice of the various possible values of the functions. Thus, if x is positive, and if the angles are always taken in the first quadrant, the equations are correct.

EXERCISE XV

1. Find all the values of the following functions:

$$\begin{array}{llll} \sin^{-1} \frac{1}{2} \sqrt{3}, & \tan^{-1} \frac{1}{3} \sqrt{3}, & \text{vers}^{-1} \frac{1}{2}, & \cos^{-1}(-\frac{1}{2} \sqrt{2}), \\ \csc^{-1} \sqrt{2}, & \tan^{-1} \infty, & \sec^{-1} 2, & \cos^{-1}(-\frac{1}{2} \sqrt{3}). \end{array}$$

2. Prove that

$$\sin^{-1}(-x) = -\sin^{-1}x; \quad \cos^{-1}(-x) = \pi - \cos^{-1}x.$$

3. If $\sin^{-1}x + \sin^{-1}y = \pi$, prove that $x = y$.

4. If $y = \sin^{-1} \frac{1}{2}$, find $\tan y$.

5. Prove that $\cos(\sin^{-1}x) = \sqrt{1-x^2}$.

6. Prove that $\cos(2 \sin^{-1}x) = 1 - 2x^2$.

7. Prove that $\tan(\tan^{-1}x + \tan^{-1}y) = \frac{x+y}{1-xy}$.

9. Prove that $\tan^{-1}\left(\frac{x}{\sqrt{1-x^2}}\right) = \sin^{-1}x$.

10. Find the value of $\sin(\tan^{-1} \frac{5}{12})$.

12. Find the value of $\sin(\tan^{-1} \frac{1}{2} + \tan^{-1} \frac{1}{3})$.

13. If $\sin^{-1}x = 2 \cos^{-1}x$, find x .

14. Prove that $\tan(2 \tan^{-1}x) = \frac{2x}{1-x^2}$.

15. Prove that $\sin(2 \tan^{-1}x) = \frac{2x}{1+x^2}$.

CHAPTER IV

THE OBLIQUE TRIANGLE

SECTION XXXIV

LAW OF SINES

Let A, B, C denote the angles of a triangle ABC (Figs. 53 and 54), and a, b, c , respectively, the lengths of the opposite sides.

Draw $CD \perp AB$, and meeting AB (Fig. 53) or AB produced (Fig. 54) at D . Let $CD = h$.

FIG. 53

FIG. 54

In either figure, $\frac{h}{b} = \sin A$.

In Fig. 53, $\frac{h}{a} = \sin B$.

In Fig. 54, $\frac{h}{a} = \sin(180^\circ - B) = \sin B$.

Therefore, whether h lies within or without the triangle, we obtain, by division,

$$\frac{a}{b} = \frac{\sin A}{\sin B}. \quad [25]$$

By drawing perpendiculars from the vertices A and B to the opposite sides, we may obtain, in the same way,

$$\frac{b}{c} = \frac{\sin B}{\sin C}, \quad \frac{a}{c} = \frac{\sin A}{\sin C}.$$

Hence the Law of Sines:

The sides of a triangle are proportional to the sines of the opposite angles.

If we regard these three equations as proportions, and take them by alternation, it is evident that they may be written in the symmetrical form

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}.$$

Each of these equal ratios has a simple geometrical meaning which will appear if the Law of Sines is proved as follows:

Circumscribe a circle about the triangle ABC (Fig. 55), and draw the radii OB , OC . Let R denote the radius. Draw $OM \perp BC$. By Geometry, the angle $BOC = 2A$; hence, the angle $BOM = A$, then

$$BM = R \sin BOM = R \sin A.$$

$$\therefore BC \text{ or } a = 2R \sin A.$$

In like manner,

$$b = 2R \sin B, \text{ and } c = 2R \sin C.$$

Whence we obtain

$$2R = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}.$$

FIG. 55

That is: *The ratio of any side of a triangle to the sine of the opposite angle is numerically equal to the diameter of the circumscribed circle.*

SECTION XXXV

LAW OF COSINES

This law gives the value of one side of a triangle in terms of the other two sides and the angle included between them.

FIG. 56

FIG. 57

In Figs. 56 and 57, $a^2 = h^2 + \overline{BD}^2$.

In Fig. 56, $BD = c - AD$.

In Fig. 57, $BD = AD - c$;

In either case, $\overline{BD}^2 = \overline{AD}^2 - 2c \times AD + c^2$.

Therefore, in all cases, $a^2 = h^2 + \overline{AD}^2 + c^2 - 2c \times AD$.

Now, $h^2 + \overline{AD}^2 = b^2$,

and $AD = b \cos A$.

Therefore, $a^2 = b^2 + c^2 - 2bc \cos A$. [26]

In like manner it may be proved that

$$b^2 = a^2 + c^2 - 2ac \cos B,$$

$$c^2 = a^2 + b^2 - 2ab \cos C.$$

The three formulas have precisely the same form, and the Law of Cosines may be stated as follows:

The square of any side of a triangle is equal to the sum of the squares of the other two sides diminished by twice their product into the cosine of the included angle.

SECTION XXXVI

LAW OF TANGENTS

By Sect. XXXIV, p. 64, $a : b = \sin A : \sin B$;
whence, by the Theory of Proportion,

$$\frac{a - b}{a + b} = \frac{\sin A - \sin B}{\sin A + \sin B}.$$

But by [24], p. 60,

$$\frac{\sin A - \sin B}{\sin A + \sin B} = \frac{\tan \frac{1}{2}(A - B)}{\tan \frac{1}{2}(A + B)}.$$

$$\text{Therefore,} \quad \frac{a - b}{a + b} = \frac{\tan \frac{1}{2}(A - B)}{\tan \frac{1}{2}(A + B)}. \quad [27]$$

By merely changing the letters,

$$\frac{a - c}{a + c} = \frac{\tan \frac{1}{2}(A - C)}{\tan \frac{1}{2}(A + C)}, \quad \frac{b - c}{b + c} = \frac{\tan \frac{1}{2}(B - C)}{\tan \frac{1}{2}(B + C)}.$$

Hence the Law of Tangents:

The difference of two sides of a triangle is to their sum as the tangent of half the difference of the opposite angles is to the tangent of half their sum.

NOTE. If in [27] $b > a$, then $B > A$. The formula is still true, but to avoid negative numbers the formula in this case should be written

$$\frac{b - a}{b + a} = \frac{\tan \frac{1}{2}(B - A)}{\tan \frac{1}{2}(B + A)}.$$

EXERCISE XVI

1. What do the formulas of Sect. XXXIV, p. 64, become when one of the angles is a right angle?

2. Prove by means of the Law of Sines that the bisector of an angle of a triangle divides the opposite side into parts proportional to the adjacent sides.

3. What does Formula [26] become when $A = 90^\circ$? when $A = 0^\circ$? when $A = 180^\circ$? What does the triangle become in each of these cases?

NOTE. The case when $A = 90^\circ$ explains why the theorem of Sect. XXXV, p. 66, is sometimes called the *Generalized Theorem of Pythagoras*.

4. Prove (Figs. 56 and 57) that whether the angle B is acute or obtuse $c = a \cos B + b \cos A$. What are the two symmetrical formulas obtained by changing the letters? What does the formula become when $B = 90^\circ$?

5. From the three following equations (found in the last example) prove the theorem of Sect. XXXV, p. 66:

$$c = a \cos B + b \cos A,$$

$$b = a \cos C + c \cos A,$$

$$a = b \cos C + c \cos B.$$

HINT. Multiply the first equation by c , the second by b , the third by a ; then from the first subtract the sum of the second and third.

6. In Formula [27] what is the maximum value of $\frac{1}{2}(A - B)$?

7. Find the form to which Formula [27] reduces, and describe the nature of the triangle, when

$$(i) C = 90^\circ; \quad (ii) A - B = 90^\circ, \text{ and } B = C.$$

SECTION XXXVII

THE GIVEN PARTS

The formulas established in Sects. XXXIV-XXXVI, pp.

FIG. 58

64-67, together with the equation $A + B + C = 180^\circ$, are sufficient for solving every case of an oblique triangle. The three parts that determine an oblique triangle may be:

- I. One side and two angles;
- II. Two sides and the angle opposite one of these sides;
- III. Two sides and the included angle;
- IV. The three sides.

SECTION XXXVIII

|------------------------|----------------------------------|-------------------------|
| $a = 24.31$ | $\log a = 1.38578$ | $= 1.38578$ |
| $A = 45^\circ 18'$ | $\text{colog } \sin A = 0.14825$ | $= 0.14825$ |

20. Given one side of a triangle equal to 27, the adjacent angles equal each to 30° ; find the radius of the circumscribed circle. (See Sect. XXXIV, p. 65.)

SECTION XXXIX

CASE II

Given two sides a and b and the angle A opposite the side a ; find the remaining parts B , C , c .

This case, like the preceding case, is solved by means of the Law of Sines.

$$\text{Since } \frac{\sin B}{\sin A} = \frac{b}{a}, \text{ therefore } \sin B = \frac{b \sin A}{a};$$

$$C = 180^\circ - (A + B).$$

$$\text{And since } \frac{c}{a} = \frac{\sin C}{\sin A}, \text{ therefore } c = \frac{a \sin C}{\sin A}.$$

When an angle is determined by its sine it admits of two values which are supplements of each other (Sect. XXV, p. 48); hence, either value of B may be taken unless excluded by the conditions of the problem.

If $a > b$, then by Geometry $A > B$, and B must be acute whatever be the value of A ; for a triangle can have only one obtuse angle. Hence, there is *one, and only one, triangle* that will satisfy the given conditions.

FIG. 60

If $a = b$, then by Geometry $A = B$; both A and B must be acute, and *the required triangle is isosceles*.

If $a < b$, then by Geometry $A < B$, and A must be acute in order that the triangle may be possible. If A is acute, it is evident from Fig. 61, where $\angle BAC = A$, $AC = b$, $CB = CB' = a$, that *the two triangles ACB and ACB' will satisfy the given conditions*, provided a is greater than the perpendicular CP ; that is, provided a is greater than $b \sin A$ (Sect. XI, p. 20). The angles ABC and $AB'C$ are supplementary (since $\angle ABC = \angle BB'C$); they are, in fact, the supplementary angles obtained from the formula

FIG. 61

$$\sin B = \frac{b \sin A}{a}.$$

If, however, $a = b \sin A = CP$ (Fig. 61), then $\sin B = 1$, $B = 90^\circ$, and *the triangle required is a right triangle*.

If $a < b \sin A$, that is, $< CP$, then $\sin B > 1$, and *the triangle is impossible*.

These results, for convenience, may be thus stated:

Two solutions; if A is acute and the value of a lies between b and $b \sin A$.

No solution; if A is acute and $a < b \sin A$;
or if A is obtuse and $a < b$, or $a = b$.

One solution; in all other cases.

The number of solutions can often be determined by inspection. In case of doubt, find the value of $b \sin A$.

Or we may proceed to compute $\log \sin B$. If $\log \sin B = 0$, the triangle required is a right triangle. If $\log \sin B > 0$, the triangle is impossible. If $\log \sin B < 0$, there is *one solution* when $a > b$; there are *two solutions* when $a < b$.

When there are two solutions, let B' , C' , c' , denote the unknown parts of the second triangle; then,

$$B' = 180^\circ - B, \quad C' = 180^\circ - (A + B') = B - A,$$

$$c' = \frac{a \sin C'}{\sin A}.$$

EXAMPLE 1. Given $a = 16$, $b = 20$, $A = 106^\circ$; find the remaining parts.

In this case $a < b$ and $A > 90^\circ$; therefore, the triangle is impossible.

EXAMPLE 2. Given $a = 36$, $b = 80$, $A = 30^\circ$; find the remaining parts.

Here we have $b \sin A = 80 \times \frac{1}{2} = 40$; so that $a < b \sin A$ and the triangle is impossible.

SECTION XL

CASE III

Given two sides a and b and the included angle C ; find the remaining parts A , B , and c .

SOLUTION I. The angles A and B may both be found by means of Formula [27], Sect. XXXVI, p. 67, which may be written

$$\tan \frac{1}{2}(A - B) = \frac{a - b}{a + b} \times \tan \frac{1}{2}(A + B).$$

Since $\frac{1}{2}(A + B) = \frac{1}{2}(180^\circ - C)$, the value of $\frac{1}{2}(A + B)$ is known, so that this equation enables us to find the value of $\frac{1}{2}(A - B)$. We then have

$$\frac{1}{2}(A + B) + \frac{1}{2}(A - B) = A$$

and
$$\frac{1}{2}(A + B) - \frac{1}{2}(A - B) = B.$$

After A and B are known, the side c may be found by the Law of Sines, which gives its value in two ways, as follows:

$$c = \frac{a \sin C}{\sin A}, \quad \text{or} \quad c = \frac{b \sin C}{\sin B}.$$

SOLUTION II. The third side c may be found directly from the equation (Sect. XXXV, p. 66)

$$c = \sqrt{a^2 + b^2 - 2ab \cos C};$$

and then, by the Law of Sines, the following equations for computing the values of the angles A and B are obtained:

$$\sin A = a \times \frac{\sin C}{c}, \quad \sin B = b \times \frac{\sin C}{c}.$$

SOLUTION III. If, in the triangle ABC (Fig. 62), BD is drawn perpendicular to the side AC , then

$$\tan A = \frac{BD}{AD} = \frac{BD}{AC - DC}.$$

Now $BD = a \sin C$
and $DC = a \cos C$.

$$\therefore \tan A = \frac{a \sin C}{b - a \cos C}.$$

FIG. 62

By merely changing the letters,

$$\tan B = \frac{b \sin C}{a - b \cos C}.$$

It is not necessary, however, to use both formulas. When one angle, as A , has been found, the other, B , may be found from the relation $A + B + C = 180^\circ$.

When the angles are known, the third side is found by the Law of Sines, as in Solution I.

NOTE. When all three unknown parts are required, Solution I is the most convenient in practice. When only the third side, c , is desired, Solution II may be used to advantage, provided the values of a^2 and b^2 can be obtained readily without the aid of logarithms. But Solutions II and III are not adapted to logarithmic work.

EXAMPLE 1. Given $a = 748$, $b = 375$, $C = 63^\circ 35' 30''$; find A , B , and c .

| | | |
|--|--|---------------------------------|
| $a + b = 1123$ | | |
| $a - b = 378$ | $\log(a - b) = 2.57171$ | $\log b = 2.57403$ |
| $A + B = 116^\circ 24' 30''$ | $\text{colog}(a + b) = 6.94962$ | $\log \sin C = 9.95214$ |
| $\frac{1}{2}(A + B) = 58^\circ 12' 15''$ | $\log \tan \frac{1}{2}(A + B) = 0.20766$ | $\text{colog} \sin B = 0.30073$ |
| $\frac{1}{2}(A - B) = 28^\circ 10' 54''$ | $\log \tan \frac{1}{2}(A - B) = 9.72899$ | $\log c = 2.82690$ |
| $A = 86^\circ 23' 9''$ | $\frac{1}{2}(A - B) = 28^\circ 10' 54''$ | $c = 671.27$ |
| $B = 30^\circ 1' 21''$ | | |

NOTE. In the above example we use the angle B in finding the side c rather than the angle A , because A is near 90° , and therefore the use of its sine should be avoided. See Note, p. 23.

EXAMPLE 2. Given $a=4$, $c=6$, $B=60^\circ$; find the third side b .

Here Solution II may be used to advantage. We have

$$b = \sqrt{a^2 + c^2 - 2ac \cos B} = \sqrt{16 + 36 - 24} = \sqrt{28};$$

$$\log 28 = 1.44716, \quad \log \sqrt{28} = 0.72358, \quad \sqrt{28} = 5.2915;$$

that is, $b = 5.2915$.

21. In order to find the distance between two objects, A and B , separated by a pond, a station C was chosen, and the distances $CA = 426$ yards, $CB = 322.4$ yards, together with the angle $ACB = 68^\circ 42'$, were measured. Find the distance from A to B .

SECTION XLI

CASE IV

Given the three sides a, b, c ; find the angles A, B, C .

The angles may be found directly from the formulas established in Sect. XXXV, p. 66. Thus, from the formula

$$a^2 = b^2 + c^2 - 2bc \cos A,$$

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}.$$

From this equation formulas adapted to logarithmic work are deduced as follows:

For the sake of brevity, let

$$a + b + c = 2s;$$

$$\text{then } b + c - a = 2(s - a),$$

$$a - b + c = 2(s - b),$$

$$\text{and } a + b - c = 2(s - c).$$

FIG. 63

Then the value of $1 - \cos A$ is

$$\begin{aligned} 1 - \frac{b^2 + c^2 - a^2}{2bc} &= \frac{2bc - b^2 - c^2 + a^2}{2bc} = \frac{a^2 - (b - c)^2}{2bc} \\ &= \frac{(a + b - c)(a - b + c)}{2bc} \\ &= \frac{2(s - b)(s - c)}{bc}, \end{aligned}$$

and the value of $1 + \cos A$ is

$$\begin{aligned} 1 + \frac{b^2 + c^2 - a^2}{2bc} &= \frac{2bc + b^2 + c^2 - a^2}{2bc} = \frac{(b + c)^2 - a^2}{2bc} \\ &= \frac{(b + c + a)(b + c - a)}{2bc} = \frac{2s(s - a)}{bc}. \end{aligned}$$

But from Formulas [16] and [17], p. 58, it follows that

$$1 - \cos A = 2 \sin^2 \frac{1}{2} A, \text{ and } 1 + \cos A = 2 \cos^2 \frac{1}{2} A.$$

$$\therefore 2 \sin^2 \frac{1}{2} A = \frac{2(s-b)(s-c)}{bc}, \text{ and } 2 \cos^2 \frac{1}{2} A = \frac{2s(s-a)}{bc},$$

$$\text{whence} \quad \sin \frac{1}{2} A = \sqrt{\frac{(s-b)(s-c)}{bc}}, \quad [28]$$

$$\cos \frac{1}{2} A = \sqrt{\frac{s(s-a)}{bc}}, \quad [29]$$

$$\text{and by [2],} \quad \tan \frac{1}{2} A = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}}. \quad [30]$$

By merely changing the letters,

$$\sin \frac{1}{2} B = \sqrt{\frac{(s-a)(s-c)}{ac}}, \quad \sin \frac{1}{2} C = \sqrt{\frac{(s-a)(s-b)}{ab}}.$$

$$\cos \frac{1}{2} B = \sqrt{\frac{s(s-b)}{ac}}, \quad \cos \frac{1}{2} C = \sqrt{\frac{s(s-c)}{ab}}.$$

$$\tan \frac{1}{2} B = \sqrt{\frac{(s-a)(s-c)}{s(s-b)}}, \quad \tan \frac{1}{2} C = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}.$$

There is then a choice of three different formulas for finding the value of each angle. If half the angle is very near 0° , the formula for the cosine will not give a very accurate result, because the cosines of angles near 0° differ little in value; and the same holds true of the formula for the sine when half the angle is very near 90° . Hence, in the first case the formula for the sine, in the second that for the cosine, should be used.

But, in general, the formulas for the tangent are to be preferred.

It is not necessary to compute by the formulas more than two angles; for the third may then be found from the equation

$$A + B + C = 180^\circ.$$

There is this advantage, however, in computing all three angles by the formulas, that we may then use the sum of the angles as a test of the accuracy of the results.

In case it is desired to compute all the angles, the formulas for the tangent may be put in a more convenient form.

The value of $\tan \frac{1}{2} A$ may be written

$$\sqrt{\frac{(s-a)(s-b)(s-c)}{s(s-a)^2}}$$

or
$$\frac{1}{s-a} \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}.$$

Hence, if we put

$$\sqrt{\frac{(s-a)(s-b)(s-c)}{s}} = r, \quad [31]$$

we have
$$\tan \frac{1}{2} A = \frac{r}{s-a}. \quad [32]$$

Likewise, $\tan \frac{1}{2} B = \frac{r}{s-b}, \quad \tan \frac{1}{2} C = \frac{r}{s-c}.$

EXAMPLE 1. Given $a = 3.41$, $b = 2.60$, $c = 1.58$; find the angles.

Using Formula [30] and the corresponding formula for $\tan \frac{1}{2} B$, we may arrange the work as follows:

| | | |
|-----------------|-------------------------------------|--|
| $a = 3.41$ | $\text{colog } s = 9.42079$ | $\text{colog } s = 9.42079 - 10$ |
| $b = 2.60$ | $\text{colog } (s-a) = 0.41454$ | $\log (s-a) = 9.58546 - 10$ |
| $c = 1.58$ | $\log (s-b) = 0.07737$ | $\text{colog } (s-b) = 9.92263 - 10$ |
| $s = 7.59$ | $\log (s-c) = 0.34537$ | $\log (s-c) = 0.34537$ |
| $s - a = 0.385$ | $2) 0.25807$ | $2) 19.27425 - 20$ |
| $s - b = 1.195$ | $\log \tan \frac{1}{2} A = 0.12903$ | $\log \tan \frac{1}{2} B = 9.63713 - 10$ |
| $s - c = 2.215$ | $\frac{1}{2} A = 53^\circ 23' 20''$ | $\frac{1}{2} B = 23^\circ 26' 37''$ |
| | $A = 106^\circ 46' 40''$ | $B = 46^\circ 53' 14''$ |

$$\therefore A + B = 153^\circ 39' 54'', \text{ and } C = 26^\circ 20' 6''.$$

EXAMPLE 2. Solve Example 1 by finding all three angles by the use of Formulas [31] and [32].

Here the work may be compactly arranged as follows, if we find $\log \tan \frac{1}{2} A$, etc., by *subtracting* $\log(s - a)$, etc., from $\log r$ instead of adding the cologarithm:

| | | |
|---------------------------------------|-----------------------------|--------------------------------------|
| $a = 3.41$ | $\log(s - a) = 9.58546$ | $\log \tan \frac{1}{2} A = 10.12903$ |
| $b = 2.60$ | $\log(s - b) = 0.07737$ | $\log \tan \frac{1}{2} B = 9.63713$ |
| $c = 1.58$ | $\log(s - c) = 0.34537$ | $\log \tan \frac{1}{2} C = 9.36912$ |
| $2s = 7.59$ | $\text{colog } s = 9.42079$ | $\frac{1}{2} A = 53^\circ 23' 20''$ |
| $s = 3.795$ | $\log r^2 = 9.42899$ | $\frac{1}{2} B = 23^\circ 26' 37''$ |
| $s - a = 0.385$ | $\log r = 9.71450$ | $\frac{1}{2} C = 13^\circ 10' 3''$ |
| $s - b = 1.195$ | | $A = 106^\circ 46' 40''$ |
| $s - c = 2.215$ | | $B = 46^\circ 53' 14''$ |
| $2s = 7.590$ (check). | | $C = 26^\circ 20' 6''$ |
| Check, $A + B + C = 180^\circ 0' 0''$ | | |

NOTE. Even if no mistakes are made in the work, the sum of the three angles found as above may differ very slightly from 180° in consequence of the fact that logarithmic computation is at best only a method of close approximation. When a difference of this kind exists, it should be divided among the angles according to the probable amount of error for each angle.

SECTION XLII

AREA OF A TRIANGLE

CASE I

When two sides and the included angle are given.

FIG. 64

FIG. 65

In the triangle ABC (Fig. 64 or 65),

$$F = \frac{1}{2} c \times CD.$$

Now,

$$CD = a \sin B.$$

Therefore,

$$F = \frac{1}{2} ac \sin B. \quad [33]$$

Also, $F = \frac{1}{2} ab \sin C$, and $F = \frac{1}{2} bc \sin A$.

CASE II

When a side and the two adjacent angles are given.

$$\sin A : \sin C = a : c. \quad (\text{Sect. XXXIV, p. 65.})$$

Therefore,
$$c = \frac{a \sin C}{\sin A}.$$

Putting this value of c in Formula [33],

$$F = \frac{a^2 \sin B \sin C}{2 \sin A}.$$

But $\sin(B + C) = \sin(180^\circ - A) = \sin A$. (Sect. XXV, p. 48.)

Hence,
$$F = \frac{a^2 \sin B \sin C}{2 \sin(B + C)}. \quad [34]$$

CASE III

When the three sides of a triangle are given.

By Formula [12], p. 58,

$$\sin B = 2 \sin \frac{1}{2} B \times \cos \frac{1}{2} B.$$

Now, by Formula [28], p. 81,

$$\sin \frac{1}{2} B = \sqrt{\frac{(s-a)(s-c)}{ac}},$$

and by Formula [29], p. 81,

$$\cos \frac{1}{2} B = \sqrt{\frac{s(s-b)}{ac}}.$$

By substituting these values of $\sin \frac{1}{2} B$ and $\cos \frac{1}{2} B$ in the above equation, we have

$$\sin B = \frac{2}{ac} \sqrt{s(s-a)(s-b)(s-c)}.$$

By putting this value of $\sin B$ in [33], we have

$$F = \sqrt{s(s-a)(s-b)(s-c)}. \quad [35]$$

CASE IV

When the three sides and the radius of the circumscribed circle or the radius of the inscribed circle are given.

FIG. 66

If R denotes the radius of the circumscribed circle, we have, from Sect. XXXIV, p. 65,

$$\sin B = \frac{b}{2R}.$$

By putting this value of $\sin B$ in [33], we have

$$F = \frac{abc}{4R}. \quad [36]$$

If r denotes the radius of the inscribed circle, divide the triangle into three triangles by lines from the centre of this circle to the vertices; then the altitude of each of the three triangles is equal to r . Therefore,

$$F = \frac{1}{2} r(a + b + c) = rs. \quad [37]$$

By putting in this formula the value of F given in [35],

$$r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}};$$

whence r , in [31], Sect. XLI, p. 82, is equal to the radius of the inscribed circle.

PROBLEMS IN PLANE TRIGONOMETRY

FIG. 67

If two objects are not in the same horizontal plane with each other or with the point of observation, we may suppose vertical lines to be passed through the two objects and to meet the horizontal plane of the point of observation in two points. The angular distance of these two points is the *bearing* of either of the objects from the other. Thus, the angle $C'OD'$ (Fig. 67) is the bearing of C from D .

PLANE SAILING

Plane Sailing is that branch of Navigation in which the surface of the earth is considered a plane. The problems which arise are therefore solved by the methods of Plane Trigonometry.

The *difference of latitude* of two places is the arc of a meridian comprehended between the parallels of latitude passing through those places.

The *departure* between two meridians is the arc of a parallel of latitude comprehended between those meridians. It diminishes as the distance from the equator increases.

When a ship sails in such a manner as to cross successive meridians at the same angle, it is said to sail on a *rhumb-line*. This angle is called the *course*, and the *distance* between two places is measured on a rhumb-line.

If we consider the distance, departure, and difference of latitude of two places to be straight lines, lying in one plane, they form a right triangle, called *the triangle of plane sailing*. If ABC is a plane triangle, right-angled at B , and BC represents the difference of latitude of B and C , ACB will be the course from C to A , CA the distance, and D the departure, measured from B , between the meridian of A and that of B .

108. Taking the earth's equatorial diameter to be 7925.6 miles, find the length in feet of the arc of one minute of a great circle.*

109. A ship sails from latitude $43^{\circ} 45'$ S., on a course N. by E. 2345 miles. Find the latitude reached, and the departure made.

110. A ship sails from latitude $1^{\circ} 45'$ N., on a course S.E. by E., and reaches latitude $2^{\circ} 31'$ S. Find the distance, and the departure.

111. A ship sails from latitude $13^{\circ} 17'$ S., on a course N.E. by E. $\frac{3}{4}$ E., until the departure is 207 miles. Find the distance, and the latitude reached.

112. A ship sails on a course between S. and E. 244 miles, leaving latitude $2^{\circ} 52'$ S., and reaching latitude $5^{\circ} 8'$ S. Find the course, and the departure.

* The length of the arc of one minute of a great circle of the earth is called a *geographical mile* or a *knot*. In the following problems, this is the distance meant by the term "mile," unless otherwise stated.

113. A ship sails from latitude $32^{\circ} 18' \text{ N.}$, on a course between N. and W., a distance of 344 miles, and a departure of 103 miles. Find the course, and the latitude reached.

114. A ship sails on a course between S. and E., making a difference of latitude 136 miles, and a departure 203 miles. Find the distance, and the course.

115. A ship sails due north 15 *statute* miles an hour, for one day. What is the distance, in a straight line, from the point left to the point reached? (Take earth's radius, 3962.8 statute miles.)

PARALLEL AND MIDDLE LATITUDE SAILING

The *difference of longitude* of two places is the angle at the pole made by the meridians of these two places; or, it is the arc of the equator comprehended between these two meridians.

FIG. 68

FIG. 69

In **Parallel Sailing** a vessel is supposed to sail due east or due west. The distance sailed is the departure made; and the difference of longitude is found as follows:

116. Given the departure between any two meridians at any latitude; find the difference of longitude of any point on one meridian from any point on the other.

SOLUTION. In rt. $\triangle ODA$, $\angle AOD = 90^\circ - \text{lat.}$

FIG. 70

$$\text{Hence, } \frac{DA}{OA} = \sin(90^\circ - \text{lat.}) = \cos \text{lat.}$$

The $\triangle DAB$ and OEQ are similar.

$$\text{Therefore, } \frac{DA}{OE} = \frac{AB}{EQ}, \text{ or } \frac{DA}{OA} = \frac{AB}{EQ}.$$

$$\text{Hence, } \cos \text{lat.} = \frac{AB}{EQ}.$$

$$\text{Therefore, } EQ = \frac{AB}{\cos \text{lat.}} = AB \times \sec \text{lat.}$$

That is, **Diff. long. = depart. \times sec lat.**

117. A ship in latitude $42^\circ 16' \text{ N.}$, longitude $72^\circ 16' \text{ W.}$, sails due east a distance of 149 miles. What is the position of the point reached?

118. A ship in latitude $44^\circ 49' \text{ S.}$, longitude $119^\circ 42' \text{ E.}$, sails due west until it reaches longitude $117^\circ 16' \text{ E.}$ Find the distance made.

In **Middle Latitude Sailing** the departure between two places is measured on that parallel of latitude which lies midway between the parallels of the two places. Except in very high latitudes or excessive runs, this assumption produces no great error. Hence, in middle latitude sailing,

$$\text{Diff. long.} = \text{depart.} \times \sec \text{mid. lat.}$$

126. Leaving latitude $49^{\circ} 30' N.$, longitude $25^{\circ} W.$, a ship sails between S. and E. 215 miles, making a departure of 167 miles. Find the course, and position reached.

127. Leaving latitude $43^{\circ} S.$, longitude $21^{\circ} W.$, a ship sails 273 miles, and reaches latitude $40^{\circ} 17' S.$ What are the *two* courses and longitudes which will satisfy the data?

128. Leaving latitude $17^{\circ} N.$, longitude $119^{\circ} E.$, a ship sails 219 miles, making a departure of 162 miles. What four sets of answers do we get?

129. A ship in latitude 30° sails due east 360 statute miles. What is the shortest distance from the point left to the point reached? Solve the same problem for latitude 45° , 60° .

TRAVERSE SAILING

FIG. 73

Traverse Sailing is the application of the principles of Plane and Middle Latitude Sailing to cases when the ship sails from one point to another on two or more different courses. Each course is worked by itself, and these independent results are combined, as may be seen in the solution of the following examples.

130. Leaving latitude $37^{\circ} 16' S.$, longitude $18^{\circ} 42' W.$, a ship sails N.E. 104 miles, then N.N.W. 60 miles, then W. by S. 216 miles. Find the position reached, and its bearing and distance from the point left.

We have, for the first course, difference of latitude 73.5 N., departure 73.5 E.; for the second course, difference of latitude 55.4 N., departure 23 W.; for the third course, difference of latitude 42.1 S., departure 211.8 W.

On the whole, then, the ship has made 128.9 miles of north latitude, and 42.1 miles of south latitude. The place reached is therefore on a parallel of latitude 86.8 miles to the north of the parallel left, that is, in latitude $35^{\circ} 49.2' S.$

The departure is, in the same way, found to be 161.3 miles W.; and the middle latitude is $36^{\circ} 32.6'$. With these data, and the formula after Example 118, we find the difference of longitude to be 201', or $3^{\circ} 21' W.$ Hence, the longitude reached is $22^{\circ} 3' W.$

With the difference of latitude 86.8 miles, and the departure 161.3 miles, we find the course to be N. $61^{\circ} 43' W.$, and the distance 183.2 miles. The ship has reached the same point that it would have reached if it had sailed directly on a course N. $61^{\circ} 43' W.$ for a distance of 183.2 miles.

131. A ship leaves Cape Cod (Example 120), and sails S.E. by S. 114 miles, N. by E. 94 miles, W.N.W. 42 miles. Solve as in Example 130.

132. A ship leaves Cape of Good Hope (latitude $34^{\circ} 22' S.$, longitude $18^{\circ} 30' E.$), and sails N.W. 126 miles, N. by E. 84 miles, W.S.W. 217 miles. Solve as in Example 130.

$$94. \frac{\sin(x-z) + 2\sin x + \sin(x+z)}{\sin(y-z) + 2\sin y + \sin(y+z)}.$$

$$95. \frac{\cos 6x - \cos 4x}{\sin 6x + \sin 4x}.$$

$$96. \tan^{-1}(2x+1) + \tan^{-1}(2x-1).$$

$$97. \frac{1}{1+\sin^2 x} + \frac{1}{1+\cos^2 x} + \frac{1}{1+\sec^2 x} + \frac{1}{1+\csc^2 x}.$$

$$98. 2\sec^2 x - \sec^4 x - 2\csc^2 x + \csc^4 x.$$

SOLUTION OF SINGLE EQUATIONS

To solve a single equation that involves different functions of the same angle, or the same or different functions of related angles, first transform the equation, if necessary, into an equivalent equation that involves a single function of the same angle.

Employ the method of factoring, if possible, in the algebraic part of the solution.

Completely solve each equation, and check the results by substitution in the given equation.

Solve $\cos x = \sin 2x$.

By [12], p. 58,

$$\sin 2x = 2 \sin x \cos x.$$

$$\therefore \cos x = 2 \sin x \cos x.$$

$$\therefore (1 - 2 \sin x) \cos x = 0.$$

$$\therefore \cos x = 0, \text{ or } 1 - 2 \sin x = 0.$$

$$\therefore x = 90^\circ \text{ or } 270^\circ, \text{ or } 30^\circ \text{ or } 150^\circ.$$

Each of these values satisfies the given equation.

SYSTEMS OF EQUATIONS

189. Solve for x and y the system

$$x \sin \alpha + y \sin \beta = a, \quad (1)$$

$$x \cos \alpha + y \cos \beta = b. \quad (2)$$

$$(1) \times \cos \alpha, \quad x \sin \alpha \cos \alpha + y \sin \beta \cos \alpha = a \cos \alpha. \quad (3)$$

$$(2) \times \sin \alpha, \quad x \sin \alpha \cos \alpha + y \cos \beta \sin \alpha = b \sin \alpha. \quad (4)$$

$$(3) - (4), \quad y(\sin \beta \cos \alpha - \cos \beta \sin \alpha) = a \cos \alpha - b \sin \alpha. \quad (5)$$

$$\therefore y = \frac{a \cos \alpha - b \sin \alpha}{\sin(\beta - \alpha)}.$$

$$\text{Similarly,} \quad x = \frac{b \sin \beta - a \cos \beta}{\sin(\beta - \alpha)}.$$

190. Solve for x and y the system

$$\sin x + \sin y = a, \quad (1)$$

$$\cos x + \cos y = b. \quad (2)$$

Transform (1) and (2), by Sect. XXXII,

$$\text{by [20], p. 59,} \quad 2 \sin \frac{1}{2}(x+y) \cos \frac{1}{2}(x-y) = a, \quad (3)$$

$$\text{by [22], p. 59,} \quad 2 \cos \frac{1}{2}(x+y) \cos \frac{1}{2}(x-y) = b. \quad (4)$$

$$(3) \div (4), \quad \tan \frac{1}{2}(x+y) = \frac{a}{b}. \quad (5)$$

$$\therefore \sin \frac{1}{2}(x+y) = \frac{a}{\sqrt{a^2 + b^2}}. \quad (6)$$

Substitute value of $\sin \frac{1}{2}(x+y)$ in (3),

$$\cos \frac{1}{2}(x-y) = \frac{1}{2} \sqrt{a^2 + b^2}. \quad (7)$$

$$\text{From (5),} \quad x+y = 2 \tan^{-1} \frac{a}{b}. \quad (8)$$

$$\text{From (7),} \quad x-y = 2 \cos^{-1} \frac{1}{2} \sqrt{a^2 + b^2}. \quad (9)$$

$$\text{Whence} \quad x = \tan^{-1} \frac{a}{b} + \cos^{-1} \frac{1}{2} \sqrt{a^2 + b^2},$$

$$\text{and} \quad y = \tan^{-1} \frac{a}{b} - \cos^{-1} \frac{1}{2} \sqrt{a^2 + b^2}.$$

191. Solve for r and θ the system

$$r \sin \theta = a, \quad (1)$$

$$r \cos \theta = b. \quad (2)$$

$$(1) \div (2), \quad \tan \theta = \frac{a}{b}. \quad (3)$$

$$\text{From (3),} \quad \theta = \tan^{-1} \frac{a}{b}. \quad (4)$$

Square (1) and (2) and add,

$$r^2 (\sin^2 \theta + \cos^2 \theta) = a^2 + b^2.$$

$$\therefore r = \sqrt{a^2 + b^2}.$$

192. Solve for r and θ the system

$$r \sin (\theta + \alpha) = a, \quad (1)$$

$$r \cos (\theta + \beta) = b. \quad (2)$$

Expand (1) and (2),

$$r \sin \theta \cos \alpha + r \cos \theta \sin \alpha = a. \quad (3)$$

$$r \cos \theta \cos \beta - r \sin \theta \sin \beta = b. \quad (4)$$

Now solve (3) and (4) for $r \sin \theta$ and $r \cos \theta$, as in Example 189. Then solve for r and θ , as in Example 191.

193. Solve for r , θ , and ϕ the system

$$r \cos \phi \sin \theta = a, \quad (1)$$

$$r \cos \phi \cos \theta = b, \quad (2)$$

$$r \sin \phi = c. \quad (3)$$

$$(1) \div (2), \quad \tan \theta = \frac{a}{b}. \quad \therefore \theta = \tan^{-1} \frac{a}{b}. \quad (4)$$

Square (1) and (2) and add,

$$r^2 \cos^2 \phi = a^2 + b^2. \quad (5)$$

$$(3) \div (5), \quad \tan \phi = \frac{c}{\sqrt{a^2 + b^2}}. \quad \therefore \phi = \tan^{-1} \frac{c}{\sqrt{a^2 + b^2}}. \quad (6)$$

Square (3) and add to (5),

$$\begin{aligned} r^2 &= a^2 + b^2 + c^2. \\ \therefore r &= \sqrt{a^2 + b^2 + c^2}. \end{aligned} \quad (7)$$

Solve the following systems for r , θ , ϕ , x , and y :

$$\begin{aligned} 194. \quad x \sin 21^\circ + y \cos 44^\circ &= 179.70, \\ x \cos 21^\circ + y \sin 44^\circ &= 232.30. \end{aligned}$$

$$\begin{aligned} 195. \quad \sin x - \sin y &= 0.7038, \\ \cos x - \cos y &= -0.7245. \end{aligned}$$

$$\begin{aligned} 196. \quad r \sin \theta &= 92.344, \\ r \cos \theta &= 205.309. \end{aligned}$$

$$\begin{aligned} 197. \quad r \sin (\theta - 19^\circ 18') &= 59.4034, \\ r \cos (\theta - 30^\circ 54') &= 147.9347. \end{aligned}$$

$$\begin{aligned} 198. \quad r \cos \phi \cos \theta &= -46.7654, \\ r \sin \phi \cos \theta &= 81, \\ r \sin \theta &= -54. \end{aligned}$$

199. Eliminate θ from the system

$$\begin{aligned} x &= r(\theta - \sin \theta), \\ y &= r(1 - \cos \theta). \end{aligned}$$

HINT. $1 - \cos \theta = \text{vers } \theta. \quad \therefore \theta = \text{vers}^{-1} \frac{y}{r}.$

CHAPTER VI

CONSTRUCTION OF TABLES

SECTION XLIII

LOGARITHMS

Properties of Logarithms. Any positive number except unity being selected as a *base*, the index or exponent which the base must have to produce a given number is the logarithm of that number to the given base.

Thus, if $a^n = N$, then $n = \log_a N$.

$n = \log_a N$ is read, n is equal to $\log N$ to the base a .

Let a be the base, M and N any positive numbers, m and n their logarithms to the base a ; so that

$$\begin{aligned}a^m &= M, & a^n &= N, \\m &= \log_a M, & n &= \log_a N.\end{aligned}$$

Then, in any system of logarithms :

1. *The logarithm of 1 is 0.*

For, $a^0 = 1.$ $\therefore 0 = \log_a 1.$

2. *The logarithm of the base itself is 1.*

For, $a^1 = a.$ $\therefore 1 = \log_a a.$

3. *The logarithm of the reciprocal of a positive number is the negative of the logarithm of the number.*

For, if $a^n = N$, then $\frac{1}{N} = \frac{1}{a^n} = a^{-n}.$

$$\therefore \log_a \left(\frac{1}{N} \right) = -n = -\log_a N.$$

4. *The logarithm of the product of two or more positive numbers is found by adding together the logarithms of the several factors.*

$$\text{For,} \quad M \times N = a^m \times a^n = a^{m+n}.$$

$$\therefore \log_a(M \times N) = m + n = \log_a M + \log_a N.$$

Similarly for the product of three or more factors.

5. *The logarithm of the quotient of two positive numbers is found by subtracting the logarithm of the divisor from the logarithm of the dividend.*

$$\text{For,} \quad \frac{M}{N} = \frac{a^m}{a^n} = a^{m-n}.$$

$$\therefore \log_a \left(\frac{M}{N} \right) = m - n = \log_a M - \log_a N.$$

6. *The logarithm of a power of a positive number is found by multiplying the logarithm of the number by the exponent of the power.*

$$\text{For,} \quad N^p = (a^n)^p = a^{np}.$$

$$\therefore \log_a(N^p) = np = p \log_a N.$$

7. *The logarithm of the real positive value of a root of a positive number is found by dividing the logarithm of the number by the index of the root.*

$$\text{For,} \quad \sqrt[r]{N} = \sqrt[r]{a^n} = a^{\frac{n}{r}}.$$

$$\therefore \log_a \sqrt[r]{N} = \frac{n}{r} = \frac{\log_a N}{r}.$$

Change of System. Logarithms to any base a may be converted into logarithms to any other base b as follows:

Let N be any number, and let

$$n = \log_a N \text{ and } m = \log_b N.$$

Then,

$$N = a^n \text{ and } N = b^m.$$

$$\therefore a^n = b^m.$$

Taking logarithms to any base whatever,

$$n \log a = m \log b,$$

or, $\log a \times \log_a N = \log b \times \log_b N,$

from which $\log_b N$ may be found when $\log a$, $\log b$, and $\log_a N$ are given; and conversely, $\log_a N$ may be found when $\log a$, $\log b$, and $\log_b N$ are given.

Two Important Systems. Although the number of different systems of logarithms is unlimited, there are but two systems which are in common use. These are:

1. The common system, also called the Briggs, denary, or decimal system, of which the base is 10.

2. The natural system of which the base is the fixed value which the sum of the series

$$1 + \frac{1}{1} + \frac{1}{1.2} + \frac{1}{1.2.3} + \frac{1}{1.2.3.4} + \dots$$

approaches as the number of terms is indefinitely increased. This fixed value, correct to seven places of decimals, is 2.7182818, and is denoted by the letter e .

The common system is used in actual calculation; the natural system is used in the higher mathematics.

EXERCISE XXV

1. Given $\log_{10} 2 = 0.30103$, $\log_{10} 3 = 0.47712$, $\log_{10} 7 = 0.84510$; find $\log_{10} 6$, $\log_{10} 14$, $\log_{10} 21$, $\log_{10} 4$, $\log_{10} 12$, $\log_{10} 5$, $\log_{10} \frac{1}{2}$, $\log_{10} \frac{1}{3}$, $\log_{10} \frac{2}{3}$.

2. With the data of Example 1, find $\log_2 10$, $\log_2 5$, $\log_3 5$, $\log_7 \frac{1}{2}$, $\log_5 \frac{2}{3}$.

3. Given $\log_{10} e = 0.43429$; find $\log_e 2$, $\log_e 3$, $\log_e 5$, $\log_e 7$, $\log_e 8$, $\log_e 9$, $\log_e \frac{2}{3}$, $\log_e \frac{1}{3}$, $\log_e \frac{3}{2}$, $\log_e \frac{7}{5}$.

4. Find x from the equations $5^x = 12$, $16^x = 10$, $27^x = 4$.

SECTION XLIV

EXPONENTIAL AND LOGARITHMIC SERIES

Exponential Series. By the binomial theorem,

$$\begin{aligned} \left(1 + \frac{1}{n}\right)^{nx} &= 1 + nx \times \frac{1}{n} + \frac{nx(nx-1)}{1 \cdot 2} \times \frac{1}{n^2} \\ &\quad + \frac{nx(nx-1)(nx-2)}{1 \cdot 2 \cdot 3} \times \frac{1}{n^3} + \dots \\ &= 1 + x + \frac{x\left(x - \frac{1}{n}\right)}{[2]} + \frac{x\left(x - \frac{1}{n}\right)\left(x - \frac{2}{n}\right)}{[3]} + \dots \quad (1) \end{aligned}$$

This equation is true for all real values of x , since the binomial theorem may be extended to the case of incommensurable exponents (Wentworth's *College Algebra*, § 299); it is, however, true only for values of n numerically greater than 1, since $\frac{1}{n}$ must be numerically less than 1 (*College Algebra*, § 418).

As (1) is true for all values of x , it is true when $x = 1$.

$$\therefore \left(1 + \frac{1}{n}\right)^n = 1 + 1 + \frac{1 - \frac{1}{n}}{[2]} + \frac{\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right)}{[3]} + \dots \quad (2)$$

$$\text{But} \quad \left[\left(1 + \frac{1}{n}\right)^n\right]^x = \left(1 + \frac{1}{n}\right)^{nx}.$$

Hence, from (1) and (2),

$$\begin{aligned} &\left[1 + 1 + \frac{1 - \frac{1}{n}}{[2]} + \frac{\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right)}{[3]} + \dots\right]^x \\ &= 1 + x + \frac{x\left(x - \frac{1}{n}\right)}{[2]} + \frac{x\left(x - \frac{1}{n}\right)\left(x - \frac{2}{n}\right)}{[3]} + \dots \end{aligned}$$

This last equation is true for all values of n numerically greater than 1. Taking the limits of the two members as n increases without limit, we obtain

$$\left(1 + 1 + \frac{1}{2} + \frac{1}{3} + \dots\right)^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots, \quad (3)$$

and this is true for all values of x . It is easily seen that both series are convergent for all values of x .

The sum of the infinite series in parenthesis is the natural base e .

$$\text{Hence, by (3), } e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \quad (4)$$

To calculate the value of e , we proceed as follows:

| | |
|---|----------|
| | 1.000000 |
| 2 | 1.000000 |
| 3 | 0.500000 |
| 4 | 0.166667 |
| 5 | 0.041667 |
| 6 | 0.008333 |
| 7 | 0.001388 |
| 8 | 0.000198 |
| 9 | 0.000025 |
| | 0.000003 |

Adding, $e = 2.71828.$

To ten places, $e = 2.7182818284.$

Limit of $\left(1 + \frac{x}{n}\right)^n$. By the binomial theorem,

$$\begin{aligned} \left(1 + \frac{x}{n}\right)^n &= 1 + n \times \frac{x}{n} + \frac{n(n-1)}{1 \cdot 2} \times \frac{x^2}{n^2} \\ &\quad + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} \times \frac{x^3}{n^3} + \dots \\ &= 1 + x + \frac{1 - \frac{1}{n}}{2} x^2 + \frac{\left(1 - \frac{1}{n}\right)\left(1 - \frac{2}{n}\right)}{6} x^3 + \dots \end{aligned}$$

This equation is true for all values of n greater than x (*College Algebra*, § 418). Take the limit as n increases without limit, x remaining finite; then

$$\begin{aligned}\lim_{n \doteq \infty} \left(1 + \frac{x}{n}\right)^n &= 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \\ &= e^x = \lim_{n \doteq \infty} \left(1 + \frac{1}{n}\right)^{nx}.\end{aligned}\quad (5)$$

Logarithmic Series.

Let $y = \log_e(1 + x)$;

then $1 + x = e^y = \lim_{n \doteq \infty} \left(1 + \frac{y}{n}\right)^n.$

If n is merely a large number, but not infinite,

$$\left(1 + \frac{y}{n}\right)^n = 1 + x + \epsilon,$$

where ϵ is a variable number which approaches the limit 0, when n increases without limit. Hence,

$$\begin{aligned}1 + \frac{y}{n} &= \sqrt[n]{1 + x + \epsilon}, \\ y &= n \sqrt[n]{1 + x + \epsilon} - n.\end{aligned}$$

If n increases without limit, and consequently ϵ approaches 0 as a limit, we have

$$y = \lim_{n \doteq \infty} [n \sqrt[n]{1 + x} - n].$$

If x is less than 1, we may expand the right-hand member of this equation by the binomial theorem. The result is

$$\begin{aligned}y &= \lim_{n \doteq \infty} \left[n \left\{ 1 + \frac{1}{n}x + \frac{1}{n} \left(\frac{1}{n} - 1 \right) \frac{x^2}{2} + \dots \right\} - n \right] \\ &= \lim_{n \doteq \infty} \left[x + \left(\frac{1}{n} - 1 \right) \frac{x^2}{2} + \left(\frac{1}{n} - 1 \right) \left(\frac{1}{n} - 2 \right) \frac{x^3}{3} + \dots \right] \\ &= x - \frac{x^2}{2} + \frac{2x^3}{3} - \frac{3x^4}{4} + \dots\end{aligned}$$

$$\therefore \log_e(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots$$

This series is known as the *logarithmic series*. It is convergent only if x lies between -1 and $+1$, or is equal to $+1$. Even within these limits it converges rather slowly, and for these reasons it is not well adapted to the computation of logarithms. A more convenient series is obtained as follows.

Calculation of Logarithms. The equation

$$\log_e(1+y) = y - \frac{y^2}{2} + \frac{y^3}{3} - \frac{y^4}{4} + \dots \quad (1)$$

holds true for all values of y numerically less than 1; therefore, if it holds true for any particular value of y less than 1, it will hold true when we put $-y$ for y ; this gives

$$\log_e(1-y) = -y - \frac{y^2}{2} - \frac{y^3}{3} - \frac{y^4}{4} - \dots \quad (2)$$

Subtracting (2) from (1), since

$$\log_e(1+y) - \log_e(1-y) = \log_e\left(\frac{1+y}{1-y}\right),$$

we find
$$\log_e\left(\frac{1+y}{1-y}\right) = 2\left(y + \frac{y^3}{3} + \frac{y^5}{5} + \dots\right).$$

Put
$$y = \frac{1}{2z+1};$$

then
$$\frac{1+y}{1-y} = \frac{z+1}{z},$$

and
$$\begin{aligned} \log_e\left(\frac{z+1}{z}\right) &= \log_e(z+1) - \log_e z \\ &= 2\left(\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \frac{1}{5(2z+1)^5} + \dots\right) \end{aligned}$$

This series is convergent for all positive values of z .

Logarithms to any base a can be calculated by the series

$$\log_a(z+1) - \log_a z = \frac{2}{\log_e a} \left(\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \frac{1}{5(2z+1)^5} + \dots \right).$$

EXAMPLE. Calculate $\log_e 2$ to five places of decimals

Let $z = 1$; then $z + 1 = 2$, $2z + 1 = 3$,

and $\log_e 2 = \frac{2}{3} + \frac{2}{3 \times 3^3} + \frac{2}{5 \times 3^5} + \frac{2}{7 \times 3^7} + \dots$

The work may be arranged as follows:

$$\begin{array}{r} 3 \overline{) 2.000000} \\ 9 \overline{) 0.666667} \div 1 = 0.666667 \\ 9 \overline{) 0.074074} \div 3 = 0.024691 \\ 9 \overline{) 0.008230} \div 5 = 0.001646 \\ 9 \overline{) 0.000914} \div 7 = 0.000131 \\ 9 \overline{) 0.000102} \div 9 = 0.000011 \\ 0.000011 \div 11 = 0.000001 \\ \log_e 2 = 0.693147 \end{array}$$

NOTE. In calculating logarithms the accuracy of the work may be tested every time we come to a composite number by adding the logarithms of the several factors. In fact, the logarithms of composite numbers are best found by addition, and then only the logarithms of prime numbers need be computed by the series.

1. Calculate to five places of decimals $\log_e 3$.
2. Calculate to five places of decimals $\log_e 5$.
3. Calculate to five places of decimals $\log_e 7$.
4. Calculate to ten places of decimals $\log_e 10$.

SECTION XLV

TRIGONOMETRIC FUNCTIONS OF SMALL ANGLES

Let $\angle AOP$ (Fig. 74) be any angle less than 90° and x its circular measure. Describe a circle of unit radius about O as a centre and take $\angle AOP' = -\angle AOP$. Draw the tangents to the circle at P and P' , meeting OA in T . Then, from Geometry,

$$\begin{aligned} \text{chord } PP' &< \text{arc } PP' \\ &< PT + P'T, \end{aligned}$$

or, by dividing by 2,

$$MP < \text{arc } AP < PT,$$

or

$$\sin x < x < \tan x.$$

Hence, dividing by $\sin x$,

$$1 < \frac{x}{\sin x} < \sec x,$$

$$1 > \frac{\sin x}{x} > \cos x. \quad (1)$$

Then $\frac{\sin x}{x}$ lies between $\cos x$ and 1.

If now the angle x is constantly diminished, $\cos x$ approaches the value 1.

Accordingly, the limit of $\frac{\sin x}{x}$, as x approaches 0, is 1.

In other words, if x is a very small angle, then $\frac{\sin x}{x}$ differs from 1 by a small value ϵ ; and this small value ϵ approaches 0 as x approaches 0.

FIG. 74

EXAMPLE. To find the sine and cosine of $1'$.

If x is the circular measure of $1'$,

$$x = \frac{2\pi}{360 \times 60} = \frac{3.14159+}{10800} = 0.00029088+,$$

the next figure in x being 8.

Now $\sin x > 0$ but $< x$; hence, $\sin 1'$ lies between 0 and 0.000290889.

$$\text{Again, } \cos 1' = \sqrt{1 - \sin^2 1'} > \sqrt{1 - (0.0003)^2} > 0.9999999.$$

$$\text{Hence, } \cos 1' = 0.9999999+.$$

$$\text{But, from (1), } \sin x > x \cos x.$$

$$\begin{aligned} \therefore \sin 1' &> 0.000290888 \times 0.9999999 \\ &> 0.000290888 (1 - 0.0000001) \\ &> 0.000290888 - 0.0000000000290888 \\ &> 0.000290887. \end{aligned}$$

Hence, $\sin 1'$ lies between 0.000290887 and 0.000290889; that is, to eight places of decimals

$$\sin 1' = 0.00029088+,$$

the next figure being 7 or 8.

EXERCISE XXVII

Given $\pi = 3.141592653589$:

1. Compute $\sin 1'$, $\cos 1'$, and $\tan 1'$ to eleven places of decimals.
2. Compute $\sin 2'$ by the same method, and also by the formula $\sin 2x = 2 \sin x \cos x$. Carry the operations to nine places of decimals. Do the two results agree?
3. Compute $\sin 1^\circ$ to four places of decimals.

4. From the formula $\cos x = 1 - 2 \sin^2 \frac{x}{2}$, show that

$$\cos x > 1 - \frac{x^2}{2}.$$

5. Show by aid of a table of natural sines that $\sin x$ and x agree to four places of decimals for all angles less than $4^\circ 40'$.

6. If the values of $\log x$ and $\log \sin x$ agree to five decimal places, find from a table the greatest value x can have.

SECTION XLVI

SIMPSON'S METHOD OF CONSTRUCTING A TRIGONOMETRIC TABLE

By Sect. XXXII, p. 59,

$$\sin(A + B) + \sin(A - B) = 2 \sin A \cos B.$$

If we put $A = x + 2y$, $B = y$,

we have $\sin(x + 3y) + \sin(x + y) = 2 \sin(x + 2y) \cos y$,

or $\sin(x + 3y) = 2 \sin(x + 2y) \cos y - \sin(x + y)$.

Similarly, $\cos(x + 3y) = 2 \cos(x + 2y) \cos y - \cos(x + y)$. (1)

If $y = 1'$, the last two equations become

$$\sin(x + 3') = 2 \sin(x + 2') \cos 1' - \sin(x + 1'),$$

$$\cos(x + 3') = 2 \cos(x + 2') \cos 1' - \cos(x + 1').$$

Hence, taking x successively equal to $-1'$, $0'$, $1'$, $2'$, \dots , we obtain

$$\sin 2' = 2 \sin 1' \cos 1',$$

$$\sin 3' = 2 \sin 2' \cos 1' - \sin 1',$$

$$\sin 4' = 2 \sin 3' \cos 1' - \sin 2',$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots$$

$$\cos 2' = 2 \cos^2 1' - 1,$$

$$\cos 3' = 2 \cos 2' \cos 1' - \cos 1',$$

$$\cos 4' = 2 \cos 3' \cos 1' - \cos 2',$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots$$

Since $\sin 1'$ and $\cos 1'$ are known, these equations enable us to compute step by step the sine and cosine of any angle. The tangent may then be found in each case as the quotient of the sine divided by the cosine.

This process need be carried only as far as 30° . For

$$\sin(30^\circ + x) + \sin(30^\circ - x) = 2 \sin 30^\circ \cos x = \cos x,$$

$$\cos(30^\circ + x) - \cos(30^\circ - x) = -2 \sin 30^\circ \sin x = -\sin x.$$

$$\therefore \sin(30^\circ + x) = \cos x - \sin(30^\circ - x),$$

$$\cos(30^\circ + x) = -\sin x + \cos(30^\circ - x).$$

Moreover, the sines and cosines need be calculated only to 45° , since

$$\sin(45^\circ + x) = \cos(45^\circ - x),$$

$$\cos(45^\circ + x) = \sin(45^\circ - x).$$

In using this method, the multiplication by $\cos 1'$, which occurs at each step, can be simplified by noting that

$$\cos 1' = 0.9999999 = 1 - 0.0000001.$$

NOTE. Simpson's method is superseded in actual practice by much more rapid and convenient processes in which we employ the expansions of the trigonometric functions in infinite series.

$$\sin 1^\circ = 0.017454+, \quad \cos 1^\circ = 0.999848+: \quad .$$

2. Compute the sine and cosine of two degrees.
3. Compute the sine and cosine of three degrees.
4. Compute the sine and cosine of four degrees.
5. Compute the sine and cosine of five degrees.

SECTION XLVII

DE MOIVRE'S THEOREM

Expressions of the form

$$\cos x + i \sin x,$$

when $i = \sqrt{-1}$, play an important part in modern analysis.

Given two such expressions,

$$\cos x + i \sin x, \quad \cos y + i \sin y$$

their product is

$$\begin{aligned} & (\cos x + i \sin x)(\cos y + i \sin y) \\ &= \cos x \cos y - \sin x \sin y + i(\cos x \sin y + \sin x \cos y) \\ &= \cos(x + y) + i \sin(x + y). \end{aligned}$$

Hence, the product of two expressions of the form

$$\cos x + i \sin x, \quad \cos y + i \sin y$$

is an expression of the same form in which x or y is replaced by $x + y$. In other words, the angle which enters into such a product is the sum of the angles of the factors.

If x and y are equal, we have at once, from the preceding,

$$(\cos x + i \sin x)^2 = \cos 2x + i \sin 2x;$$

and again,

$$\begin{aligned} (\cos x + i \sin x)^3 &= (\cos x + i \sin x)^2 (\cos x + i \sin x) \\ &= (\cos 2x + i \sin 2x) (\cos x + i \sin x) \\ &= \cos 3x + i \sin 3x. \end{aligned}$$

Similarly,

$$(\cos x + i \sin x)^4 = \cos 4x + i \sin 4x,$$

and in general, if n is a positive integer,

$$(\cos x + i \sin x)^n = \cos nx + i \sin nx. \quad (1)$$

Hence,

To raise the expression $\cos x + i \sin x$ to the n th power when n is a positive integer, we have only to multiply the angle x by n .

Again, if n is a positive integer as before,

$$\left(\cos \frac{x}{n} + i \sin \frac{x}{n} \right)^n = \cos x + i \sin x.$$

$$\therefore (\cos x + i \sin x)^{\frac{1}{n}} = \cos \frac{x}{n} + i \sin \frac{x}{n}.$$

Since, however, x may be increased by any integral multiple of 2π without changing $\cos x + i \sin x$, it follows that all the n expressions,

$$\cos \frac{x}{n} + i \sin \frac{x}{n}, \quad \cos \frac{x + 2\pi}{n} + i \sin \frac{x + 2\pi}{n},$$

$$\cos \frac{x + 4\pi}{n} + i \sin \frac{x + 4\pi}{n}, \dots,$$

$$\cos \frac{x + (n-1)2\pi}{n} + i \sin \frac{x + (n-1)2\pi}{n},$$

are n th roots of $\cos x + i \sin x$. There are no other roots, since

$$\begin{aligned} \cos \frac{x + n2\pi}{n} + i \sin \frac{x + n2\pi}{n} \\ = \cos \left(\frac{x}{n} + 2\pi \right) + i \sin \left(\frac{x}{n} + 2\pi \right) = \cos \frac{x}{n} + i \sin \frac{x}{n}; \end{aligned}$$

$$\begin{aligned} \text{and } \cos \frac{x + (n+1)2\pi}{n} + i \sin \frac{x + (n+1)2\pi}{n} \\ = \cos \left(\frac{x + 2\pi}{n} + 2\pi \right) + i \sin \left(\frac{x + 2\pi}{n} + 2\pi \right) \\ = \cos \frac{x + 2\pi}{n} + i \sin \frac{x + 2\pi}{n}, \end{aligned}$$

and so on.

Hence, if n is a positive integer,

$$\begin{aligned} \cos x + i \sin x)^{\frac{1}{n}} \\ = \cos \frac{x + 2k\pi}{n} + i \sin \frac{x + 2k\pi}{n} \quad (k = 0, 1, 2, \dots, n-1). \quad (2) \end{aligned}$$

From (1) and (2) it follows at once that if m and n are positive integers,

$$\begin{aligned} (\cos x + i \sin x)^{\frac{m}{n}} &= \{(\cos x + i \sin x)^{\frac{1}{n}}\}^m \\ &= \cos \frac{m}{n}(x + 2k\pi) + i \sin \frac{m}{n}(x + 2k\pi) \\ &\quad (k = 0, 1, 2, \dots, n-1). \quad (3) \end{aligned}$$

Finally, if $-\frac{m}{n}$ is a negative fraction,

$$(\cos x + i \sin x)^{-\frac{m}{n}} = \frac{1}{(\cos x + i \sin x)^{\frac{m}{n}}}.$$

$$\begin{aligned} \text{But } \frac{1}{\cos x + i \sin x} &= \frac{\cos x - i \sin x}{(\cos x + i \sin x)(\cos x - i \sin x)} \\ &= \frac{\cos x - i \sin x}{\cos^2 x + \sin^2 x} \\ &= \cos x - i \sin x \\ &= \cos(-x) + i \sin(-x). \end{aligned}$$

Hence, $(\cos x + i \sin x)^{-\frac{m}{n}} = \{\cos(-x) + i \sin(-x)\}^{\frac{m}{n}}$

$$\begin{aligned} &\cos \frac{m}{n}(-x + 2k\pi) + i \sin \frac{m}{n}(-x + 2k\pi), \\ &\quad (k = 0, 1, 2, \dots, n-1) \\ &= \cos \left\{ -\frac{m}{n}(x + 2k\pi) \right\} + i \sin \left\{ -\frac{m}{n}(x + 2k\pi) \right\}, \\ &\quad (k = 0, 1, 2, \dots, n-1). \quad (4) \end{aligned}$$

Consequently, if n is a positive or negative integer or fraction,

$$(\cos x + i \sin x)^n = \cos [n(x + 2k\pi)] + i \sin [n(x + 2k\pi)],$$

$$(k = 0, 1, 2, \dots, n-1). \quad (5)$$

EXAMPLE. Find the three cube roots of -1 .

We have $-1 = \cos 180^\circ + i \sin 180^\circ$.

$$\therefore (-1)^{\frac{1}{3}} = \cos \frac{180^\circ + 2k\pi}{3} + i \sin \frac{180^\circ + 2k\pi}{3} \quad (k = 0, 1, 2).$$

For the three cube roots of -1 we find, therefore,

$$\cos 60^\circ + i \sin 60^\circ, \quad \cos 180^\circ + i \sin 180^\circ, \quad \cos 300^\circ + i \sin 300^\circ,$$

or $\frac{1 + i\sqrt{3}}{2}, \quad -1, \quad \frac{1 - i\sqrt{3}}{2}.$

By aid of De Moivre's Theorem, we may express $\sin n\theta$ and $\cos n\theta$, when n is an integer, in terms of $\sin \theta$ and $\cos \theta$.

Thus, $\cos n\theta + i \sin n\theta = (\cos \theta + i \sin \theta)^n$

$$= \cos^n \theta + in \cos^{n-1} \theta \sin \theta + i^2 \frac{n(n-1)}{2} \cos^{n-2} \theta \sin^2 \theta$$

$$+ i^3 \frac{n(n-1)(n-2)}{3} \cos^{n-3} \theta \sin^3 \theta + \dots$$

Or, since $i^2 = -1$, $i^3 = -i$, $i^4 = +1$, \dots ,

$$\cos n\theta + i \sin n\theta = \cos^n \theta + in \cos^{n-1} \theta \sin \theta$$

$$- \frac{n(n-1)}{2} \cos^{n-2} \theta \sin^2 \theta - i \frac{n(n-1)(n-2)}{3} \cos^{n-3} \theta \sin^3 \theta + \dots$$

Equating now the real parts and the imaginary parts separately, we obtain

$$\cos n\theta = \cos^n \theta - \frac{n(n-1)}{2} \cos^{n-2} \theta \sin^2 \theta$$

$$+ \frac{n(n-1)(n-2)(n-3)}{4} \cos^{n-4} \theta \sin^4 \theta - \dots,$$

$$\begin{aligned}\sin n\theta &= n \cos^{n-1}\theta \sin \theta - \frac{n(n-1)(n-2)}{2} \cos^{n-3}\theta \sin^3\theta \\ &+ \frac{n(n-1)(n-2)(n-3)(n-4)}{24} \cos^{n-5}\theta \sin^5\theta - \dots\end{aligned}$$

EXERCISE XXIX

1. Find the six 6th roots of -1 ; of $+1$.
2. Find the three cube roots of i .
3. Find the four 4th roots of $-i$.
4. Express $\sin 4\theta$ and $\cos 4\theta$ in terms of $\sin \theta$ and $\cos \theta$.

SECTION XLVIII

EXPANSION OF $\sin x$, $\cos x$, AND $\tan x$ IN INFINITE SERIES

Let one radian be denoted simply by 1, and let

$$\cos 1 + i \sin 1 = k.$$

Then $\cos x + i \sin x = (\cos 1 + i \sin 1)^x = k^x$,

and, putting $-x$ for x ,

$$\cos(-x) + i \sin(-x) = \cos x - i \sin x = k^{-x}.$$

That is, $\cos x + i \sin x = k^x$,

and $\cos x - i \sin x = k^{-x}$.

By taking the sum and difference of these two equations, and dividing the sum by 2 and the difference by $2i$, we have

$$\cos x = \frac{1}{2}(k^x + k^{-x}), \quad \sin x = \frac{1}{2i}(k^x - k^{-x}).$$

But $k^x = (e^{\log k})^x = e^{x \log k}$, $k^{-x} = e^{-x \log k}$,

and $e^{x \log k} = 1 + x \log k + \frac{x^2 (\log k)^2}{2} + \frac{x^3 (\log k)^3}{3} + \dots$,

$$e^{-x \log k} = 1 - x \log k + \frac{x^2 (\log k)^2}{[2]} - \frac{x^3 (\log k)^3}{[3]} + \dots$$

$$\therefore \cos x = \frac{1}{2} (k^x + k^{-x}) = 1 + \frac{x^2 (\log k)^2}{[2]} + \frac{x^4 (\log k)^4}{[4]} + \dots,$$

$$\sin x = \frac{1}{i} \left\{ x \log k + \frac{x^3 (\log k)^3}{[3]} + \frac{x^5 (\log k)^5}{[5]} + \dots \right\}.$$

It only remains to find the value of k , and this can be obtained by dividing the last equation through by x and letting x approach 0 indefinitely.

Then we have

$$\lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right) = \frac{1}{i} \log k.$$

But $\lim_{x \rightarrow 0} \left(\frac{\sin x}{x} \right) = 1.$

$$\therefore \log k = i.$$

$$\therefore k = e^i.$$

Therefore, we have

$$\cos x = \frac{1}{2} (e^{xi} + e^{-xi}) = 1 - \frac{x^2}{[2]} + \frac{x^4}{[4]} - \frac{x^6}{[6]} + \dots,$$

$$\sin x = \frac{1}{2i} (e^{xi} - e^{-xi}) = x - \frac{x^3}{[3]} + \frac{x^5}{[5]} - \frac{x^7}{[7]} \dots$$

From the last two series we obtain, by division,

$$\tan x = \frac{\sin x}{\cos x} = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} \dots$$

By the aid of these series the trigonometric functions of any angle are readily calculated.

In the computation it must be remembered that x is the *circular measure* of the given angle.

$$34. \sin A + \sin B + \sin C = \sin A + \sin B + \sin[180^\circ - (A + B)]$$

$$= \sin A + \sin B + \sin(A + B)$$

By [20] and [12],

$$= 2 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}(A - B) + 2 \sin \frac{1}{2}(A + B) \cos \frac{1}{2}(A + B)$$

$$= 2 \sin \frac{1}{2}(A + B) [\cos \frac{1}{2}(A - B) + \cos \frac{1}{2}(A + B)]$$

By [22],

$$= 2 \sin \frac{1}{2}(A + B) (2 \cos \frac{1}{2} A \cos \frac{1}{2} B)$$

$$= 4 \sin \frac{1}{2}(A + B) \cos \frac{1}{2} A \cos \frac{1}{2} B.$$

But $\cos \frac{1}{2} C = \cos[90^\circ - \frac{1}{2}(A + B)] = \sin \frac{1}{2}(A + B).$

$$\therefore \sin A + \sin B + \sin C = 4 \cos \frac{1}{2} A \cos \frac{1}{2} B \cos \frac{1}{2} C.$$

INTRODUCTION.

1. If the natural numbers are regarded as powers of ten, the exponents of the powers are the Common or Briggs Logarithms of the numbers. If A and B denote natural numbers, a and b their logarithms, then $10^a = A$, $10^b = B$; or, written in logarithmic form,

$$\log A = a, \quad \log B = b.$$

2. The logarithm of a product is found by adding the logarithms of its factors.

$$\begin{aligned} \text{For,} \quad & A \times B = 10^a \times 10^b = 10^{a+b}. \\ \text{Therefore,} \quad & \log (A \times B) = a + b = \log A + \log B. \end{aligned}$$

3. The logarithm of a quotient is found by subtracting the logarithm of the divisor from that of the dividend.

$$\begin{aligned} \text{For,} \quad & \frac{A}{B} = \frac{10^a}{10^b} = 10^{a-b}. \\ \text{Therefore,} \quad & \log \frac{A}{B} = a - b = \log A - \log B. \end{aligned}$$

4. The logarithm of a power of a number is found by multiplying the logarithm of the number by the exponent of the power.

$$\begin{aligned} \text{For,} \quad & A^n = (10^a)^n = 10^{an}. \\ \text{Therefore,} \quad & \log A^n = an = n \log A. \end{aligned}$$

5. The logarithm of the root of a number is found by dividing the logarithm of the number by the index of the root.

$$\begin{aligned} \text{For,} \quad & \sqrt[n]{A} = \sqrt[n]{10^a} = 10^{\frac{a}{n}}. \\ \text{Therefore,} \quad & \log \sqrt[n]{A} = \frac{a}{n} = \frac{\log A}{n}. \end{aligned}$$

6. The logarithms of 1, 10, 100, etc., and of 0.1, 0.01, 0.001, etc., are integral numbers. The logarithms of all other numbers are fractions.

For, $10^0 = 1$, hence $\log 1 = 0$; $10^{-1} = 0.1$, hence $\log 0.1 = -1$;
 $10^1 = 10$, hence $\log 10 = 1$; $10^{-2} = 0.01$, hence $\log 0.01 = -2$;
 $10^2 = 100$, hence $\log 100 = 2$; $10^{-3} = 0.001$, hence $\log 0.001 = -3$;
 $10^3 = 1000$, hence $\log 1000 = 3$; and so on.

If the number is between 1 and 10, the logarithm is between 0 and 1.
 If the number is between 10 and 100, the logarithm is between 1 and 2.
 If the number is between 100 and 1000, the logarithm is between 2 and 3.
 If the number is between 1 and 0.1, the logarithm is between 0 and -1.
 If the number is between 0.1 and 0.01, the logarithm is between -1 and -2.
 If the number is between 0.01 and 0.001, the logarithm is between -2 and -3.
 And so on.

7. If the number is less than 1, the logarithm is negative (§ 6), but is written in such a form that the *fractional part* is always *positive*.

For the number may be regarded as the product of two factors, one of which lies between 1 and 10, and the other is a negative power of 10; the logarithm will then take the form of a *difference* whose minuend is a positive proper fraction, and whose subtrahend is a positive integral number.

Thus, $0.48 = 4.8 \times 0.1$.

Therefore (§ 2), $\log 0.48 = \log 4.8 + \log 0.1 = 0.68124 - 1$. (Page 1.)

Again, $0.0007 = 7 \times 0.0001$.

Therefore, $\log 0.0007 = \log 7 + \log 0.0001 = 0.84510 - 4$.

The logarithm $0.84510 - 4$ is often written $\bar{4}.84510$.

8. Every logarithm, therefore, consists of two parts: a positive or negative integral number, which is called the **Characteristic**, and a *positive* proper fraction, which is called the **Mantissa**.

Thus, in the logarithm 3.52179, the integral number 3 is the characteristic, and the fraction .52179 the mantissa. In the logarithm $0.78254 - 2$, the integral number -2 is the characteristic, and the fraction 0.78254 is the mantissa.

9. If the logarithm is *negative*, it is customary to change the form of the difference so that the subtrahend shall be 10 or a multiple of 10. This is done by adding to both minuend and subtrahend a number which will increase the subtrahend to 10 or a multiple of 10.

Thus, the logarithm $0.78254 - 2$ is changed to $8.78254 - 10$ by adding 8 to both minuend and subtrahend. The logarithm $0.92737 - 13$ is changed to $7.92737 - 20$ by adding 7 to both minuend and subtrahend.

10. The following rules are derived from § 6:—

If the number is *greater than* 1, make the characteristic of the logarithm *one unit less* than the *number of figures* on the left of the decimal point.

If the number is *less than* 1, make the characteristic of the logarithm *negative*, and *one unit more* than the *number of zeros* between the decimal point and the first significant figure of the given number.

If the characteristic of a given logarithm is *positive*, make the *number of figures* in the integral part of the corresponding number *one more* than the number of units in the characteristic.

If the characteristic is *negative*, make the *number of zeros* between the decimal point and the first significant figure of the corresponding number *one less* than the number of units in the characteristic.

Thus, the characteristic of $\log 7849.27 = 3$;

the characteristic of $\log 0.037 = -2 = 8.00000 - 10$.

If the characteristic is 4, the corresponding number has five figures in its integral part. If the characteristic is -3 , that is, $7.00000 - 10$, the corresponding fraction has two zeros between the decimal point and the first significant figure.

11. The logarithms of numbers that can be derived one from another by multiplication or division by an integral power of 10 have the same mantissa.

For, multiplying or dividing a number by an integral power of 10 will increase or diminish its logarithm by the exponent of that power of 10; and since this exponent is an integer, the mantissa of the logarithm will be unaffected.

Thus, $\log 4.6021 = 0.66296$. (Page 9.)
 $\log 460.21 = \log (4.6021 \times 10^2) = \log 4.6021 + \log 10^2$
 $= 0.66296 + 2 = 2.66296$.
 $\log 460210 = \log (4.6021 \times 10^5) = \log 4.6021 + \log 10^5$
 $= 0.66296 + 5 = 5.66296$.
 $\log 0.046021 = \log (4.6021 \div 10^2) = \log 4.6021 - \log 10^2$
 $= 0.66296 - 2 = 8.66296 - 10$.

TABLE I.

12. In this table (pp. 1-19) the vertical columns headed N contain the numbers, and the other columns the logarithms. On page 1 both the characteristic and the mantissa are printed. On pages 2-19 the mantissa only is printed.

The fractional part of a logarithm can be expressed only approximately, and in a five-place table all figures that follow the fifth are rejected. Whenever the sixth figure is 5, or more, the fifth figure is increased by 1. The figure 5 is written when the value of the figure in the place in which it stands, together with the succeeding figures, is more than $4\frac{1}{2}$, but less than 5.

Thus, if the mantissa of a logarithm written to seven places is 5328782, it is written in this table (a five-place table) 53287. If it is 5328751, it is written 53288. If it is 5328461 or 5328499, it is written in this table 53285.

Again, if the mantissa is 5324981, it is written 53250; and if it is 4999967, it is written 50000.

This distinction between 5 and 5, in case it is desired to curtail still further the mantissas of logarithms, removes all doubt whether a 5 in the last given place, or in the last but one followed by a zero, should be simply rejected, or whether the rejection should lead us to increase the preceding figure by one unit.

Thus, the mantissa 13925 when reduced to four places should be 1392; but 13925 should be 1393.

TO FIND THE LOGARITHM OF A GIVEN NUMBER.

13. If the given number consists of one or two significant figures, the logarithm is given on page 1. If zeros follow the significant figures, or if the number is a proper decimal fraction, the characteristic must be determined by § 10.

14. If the given number has three significant figures, it will be found in the column headed N (pp. 2-19), and the mantissa of its logarithm in the next column to the right, and on the same line. Thus,

| | | |
|----------|--------------------|---------------------------|
| Page 2. | log 145 = 2.16137, | log 14500 = 4.16137. |
| Page 14. | log 716 = 2.85491, | log 0.716 = 9.85491 - 10. |

15. If the given number has four significant figures, the first three will be found in the column headed N, and the fourth at the top of the page in the line containing the figures **1, 2, 3**, etc. The mantissa will be found in the column headed by the fourth figure, and on the same line with the first three figures. Thus,

| | | |
|----------|----------------------|----------------------------|
| Page 15. | log 7682 = 3.88547, | log 76.85 = 1.88564. |
| Page 18. | log 93280 = 4.96979, | log 0.9468 = 9.97626 - 10. |

16. If the given number has five or more significant figures, a process called **interpolation** is required.

Interpolation is based on the *assumption* that between two consecutive mantissas of the table the change in the mantissa is directly proportional to the change in the number.

Required the logarithm of 34237.

The required mantissa is (§ 11) the same as the mantissa for 3423.7; therefore it will be found by adding to the mantissa of 3423 seven-tenths of the difference between the mantissas for 3423 and 3424.

The mantissa for 3423 is 53441.

The difference between the mantissas for 3423 and 3424 is 12.

Hence, the mantissa for 3423.7 is $53441 + (0.7 \times 12) = 53449$.

Therefore, the required logarithm of 34237 is 4.53449.

Required the logarithm of 0.0015764.

The required mantissa is the same as the mantissa for 1576.4; therefore it will be found by adding to the mantissa for 1576 four-tenths of the difference between the mantissas for 1576 and 1577.

The mantissa for 1576 is 19756.

The difference between the mantissas for 1576 and 1577 is 27.

Hence, the mantissa for 1576.4 is $19756 + (0.4 \times 27) = 19767$.

Therefore, the required logarithm of 0.0015764 is $7\ 19767 - 10$.

Required the logarithm of 32.6708.

The required mantissa is the same as the mantissa for 3267.08; therefore it will be found by adding to the mantissa for 3267 eight-hundredths of the difference between the mantissas for 3267 and 3268.

The mantissa for 3267 is 51415.

The difference between the mantissas for 3267 and 3268 is 13.

Hence, the mantissa for 3267.08 is $51415 + (0.08 \times 13) = 51416$.

Therefore, the required logarithm of 32.6708 is 1.51416 .

17. When the fraction of a unit in the part to be added to the mantissa for four figures is less than 0.5 it is to be neglected; when it is 0.5 or more than 0.5 it is to be taken as one unit.

Thus, in the first example, the part to be added to the mantissa for 3423 is 8.4, and the .4 is rejected. In the second example, the part to be added to the mantissa for 1576 is 10.8, and 11 is added.

TO FIND THE ANTILOGARITHM; THAT IS, THE NUMBER CORRESPONDING TO A GIVEN LOGARITHM.

18. If the given mantissa can be found in the table, the first three figures of the required number will be found in the same line with the mantissa in the column headed N, and the fourth figure at the top of the column containing the mantissa.

The position of the decimal point is determined by the characteristic (§ 10).

Find the number corresponding to the logarithm 0.92002.

Page 16. The number for the mantissa 92002 is 8318.

The characteristic is 0; therefore, the required number is 8.318.

Find the number corresponding to the logarithm 6.09167.

Page 2. The number for the mantissa 09167 is 1235.

The characteristic is 6; therefore, the required number is 1235000.

Find the number corresponding to the logarithm 7.50325 — 10.

Page 6. The number for the mantissa 50325 is 3186.

The characteristic is — 3; therefore, the required number is 0.003186.

19. If the given mantissa cannot be found in the table, find in the table the two adjacent mantissas between which the given mantissa lies, and the four figures corresponding to the smaller of these two mantissas will be the first four significant figures of the required number. If more than four figures are desired, they may be found by interpolation, as in the following examples:

Find the number corresponding to the logarithm 1.48762.

Here the two adjacent mantissas of the table, between which the given mantissa 48762 lies, are found to be (page 6) 48756 and 48770. The corresponding numbers are 3073 and 3074. The smaller of these, 3073, contains the first four significant figures of the required number.

The difference between the two adjacent mantissas is 14, and the difference between the corresponding numbers is 1.

The difference between the smaller of the two adjacent mantissas, 48756, and the given mantissa, 48762, is 6. Therefore, the number to be annexed to 3073 is $\frac{6}{14}$ of 1 = 0.428, and the fifth significant figure of the required number is 4.

Hence, the required number is 30.734.

Find the number corresponding to the logarithm 7.82326 — 10.

The two adjacent mantissas between which 82326 lies are (page 13) 82321 and 82328. The number corresponding to the mantissa 82321 is 6656.

The difference between the two adjacent mantissas is 7, and the difference between the corresponding numbers is 1.

The difference between the smaller mantissa, 82321, and the given mantissa, 82326, is 5. Therefore, the number to be annexed to 6656 is $\frac{5}{7}$ of 1 = 0.7, and the fifth significant figure of the required number is 7.

Hence, the required number is 0.0066567.

In using a five-place table the numbers corresponding to mantissas may be carried to five significant figures, and in the first part of the table to six figures.*

20. The logarithm of the reciprocal of a number is called the **Cologarithm** of the number.

If A denotes any number, then

$$\text{colog } A = \log \frac{1}{A} = \log 1 - \log A \text{ (§ 3)} = -\log A.$$

Hence, the cologarithm of a number is equal to the logarithm of the number with the minus sign prefixed, *which sign affects the entire logarithm, both characteristic and mantissa.*

* In most tables of logarithms proportional parts are given as an aid to interpolation; but, after a little practice, the operation can be performed nearly as rapidly without them. Their omission allows a page with larger-faced type and more open spacing, and consequently less trying to the eyes.

In order to avoid a negative mantissa in the cologarithm, it is customary to substitute for $-\log A$ its equivalent

$$(10 - \log A) - 10.$$

Hence, the cologarithm of a number is found by subtracting the logarithm of the number from 10, and then annexing -10 to the remainder.

The best way to perform the subtraction is to begin on the left and subtract each figure of $\log A$ from 9 until we reach the last significant figure, which must be subtracted from 10.

If $\log A$ is greater in absolute value than 10 and less than 20, then in order to avoid a negative mantissa, it is necessary to write $-\log A$ in the form

$$(20 - \log A) - 20.$$

So that, in this case, $\text{colog } A$ is found by subtracting $\log A$ from 20, and then annexing -20 to the remainder.

Find the cologarithm of 4007.

$$\begin{array}{r} \text{Page 8.} \quad \log 4007 = \begin{array}{r} 10 \quad - 10 \\ 3.60282 \end{array} \\ \text{colog } 4007 = \begin{array}{r} 6.39718 - 10 \end{array} \end{array}$$

Find the cologarithm of 103992000000.

$$\begin{array}{r} \text{Page 2.} \quad \log 103992000000 = \begin{array}{r} 20 \quad - 20 \\ 11.01700 \end{array} \\ \text{colog } 103992000000 = \begin{array}{r} 8.98300 - 20 \end{array} \end{array}$$

If the characteristic of $\log A$ is negative, then the subtrahend, -10 or -20 , will vanish in finding the value of $\text{colog } A$.

Find the cologarithm of 0.004007.

$$\begin{array}{r} \log 0.004007 = \begin{array}{r} 10 \quad - 10 \\ 7.60282 - 10 \end{array} \\ \text{colog } 0.004007 = \begin{array}{r} 2.39718 \end{array} \end{array}$$

With practice, the cologarithm of a number can be taken from the table as rapidly as the logarithm itself.

By using cologarithms the inconvenience of subtracting the logarithm of a divisor is avoided. For dividing by a number is equivalent to multiplying by its reciprocal. Hence, instead of subtracting the logarithm of a divisor its cologarithm may be added.

If the given number is a proper fraction, its logarithm will have as a subtrahend 10 or a multiple of 10. TABLE II.

22. This table (page 20) contains the value of the number π , its most useful combinations, and their logarithms.

Find the length of an arc of $47^\circ 32' 57''$ in a unit circle.

$$\begin{aligned}
 47^\circ 32' 57'' &= 171177'' \\
 \log 171177 &= 5.23344 \\
 \log \frac{1}{\alpha''} &= 4.68557 - 10 \\
 \log \text{arc } 47^\circ 32' 57'' &= 9.91901 - 10 = \log 0.82994 \\
 \therefore \text{length of arc} &= 0.82994.
 \end{aligned}$$

Find the angle if the length of its arc in a unit circle $= 0.54936$.

$$\begin{aligned}
 \log 0.54936 &= 9.73986 - 10 \\
 \operatorname{colog} \frac{1}{\alpha''} = \log \alpha'' &= 5.31443 \\
 \log \text{angle} &= 5.05429 = \log 113316 \\
 \therefore \text{angle} &= 113316'' = 31^\circ 28' 36''.
 \end{aligned}$$

23. The relations between arcs and angles given in Table II. are readily deduced from the circular measure of an angle.

In **Circular Measure** an angle is defined by the equation

$$\text{angle} = \frac{\text{arc}}{\text{radius}},$$

in which the word arc denotes the length of the arc corresponding to the angle, when both arc and radius are expressed in terms of the *same linear unit*.

Since the arc and radius for a given angle in different circles vary in the same ratio, the value of the angle given by this equation is independent of the value of the radius.

The angle which is measured by a radius-arc is called a **Radian**, and is the *angular unit* in circular measure.

Since $C = 2\pi R$, it follows that $\frac{C}{R} = 2\pi$, and $\frac{\frac{1}{2}C}{R} = \pi$. Therefore,

If the arc = circumference, the angle = 2π .

If the arc = semicircumference, the angle = π .

If the arc = quadrant, the angle = $\frac{1}{2}\pi$.

If the arc = radius, the angle = 1.

Therefore, $\pi = 180^\circ$, $\frac{1}{2}\pi = 90^\circ$, $\frac{1}{3}\pi = 60^\circ$, $\frac{1}{4}\pi = 45^\circ$, $\frac{1}{6}\pi = 30^\circ$, $\frac{1}{8}\pi = 22\frac{1}{2}^\circ$, and so on.

Since 180° in common measure equals π units in circular measure,

$$1^\circ \text{ in common measure} = \frac{\pi}{180} \text{ units in circular measure};$$

$$1 \text{ unit in circular measure} = \frac{180^\circ}{\pi} \text{ in common measure.}$$

By means of these two equations, the value of an angle expressed in one measure may be changed to its value in the other measure.

Thus, the angle whose arc is equal to the radius is an angle of 1 unit in circular measure, and is equal to $\frac{180^\circ}{\pi}$, or $57^\circ 17' 45''$, very nearly.

TABLE III.

24. This table (pp. 21–49) contains the logarithms of the trigonometric functions of angles. In order to avoid negative characteristics, the characteristic of every logarithm is printed 10 too large. Therefore, -10 is to be annexed to each logarithm.

On pages 28–49 the characteristic remains the same throughout each column, and is printed at the top and the bottom of the column.

But on pp. 30, 49, the characteristic changes one unit in value at the places marked with bars. Above these bars the proper characteristic is printed at the top, and below them at the bottom, of the column.

25. On pages 28–49 the log sin, log tan, log cot, and log cos, of 1° to 89° , are given to every minute. Conversely, this part of the table gives the value of the angle to the nearest minute when log sin, log tan, log cot, or log cos is known, provided log sin or log cos lies between 8.24186 and 9.99993, and log tan or log cot lies between 8.24192 and 11.75808.

If the exact value of the given logarithm of a function is not found in the table, the value nearest to it is to be taken, unless interpolation is employed as explained in § 26.

If the angle is less than 45° the number of degrees is printed at the top of the page, and the number of minutes in the column to the left of the columns containing the logarithm. If the angle is greater than 45° , the number of degrees is printed at the bottom of the page, and the number of minutes in the column to the right of the columns containing the logarithms.

If the angle is less than 45° , the names of its functions are printed at the top of the page; if greater than 45° , at the bottom of the page. Thus,

Page 38. $\log \sin 21^\circ 37' = 9.56631 - 10$.

Page 45. $\log \cot 36^\circ 53' = 10.12473 - 10 = 0.12473$.

Page 37. $\log \cos 69^\circ 14' = 9.54969 - 10$.

Page 49. $\log \tan 45^\circ 59' = 10.01491 - 10 = 0.01491$.

Page 48. If $\log \cos = 9.87463 - 10$, angle = $41^\circ 28'$.

Page 34. If $\log \cot = 9.39353 - 10$, angle = $76^\circ 6'$.

If $\log \sin = 9.47780 - 10$, the nearest log sin in the table is $9.47774 - 10$ (page 36), and the angle corresponding to this value is $17^\circ 29'$.

If $\log \tan = 0.76520 = 10.76520 - 10$, the nearest log tan in the table is $10.76490 - 10$ (page 32), and the angle corresponding to this value is $80^\circ 15'$.

26. If it is desired to obtain the logarithms of the functions of angles that contain seconds, or to obtain the value of the angle in degrees, minutes, and seconds, from the logarithms of its functions, interpolation must be employed. Here it must be remembered that,

The difference between two consecutive angles in the table is $60''$.

Log sin and log tan increase as the angle increases; log cos and log cot diminish as the angle increases.

Find $\log \tan 70^\circ 46' 8''$.

Page 37. $\log \tan 70^\circ 46' = 0.45731$.

The difference between the mantissas of $\log \tan 70^\circ 46'$ and $\log \tan 70^\circ 47'$ is 41, and $\frac{8}{60}$ of 41 = 5.

As the function is increasing, the 5 must be added to the figure in the fifth place of the mantissa 45731; and

Therefore $\log \tan 70^\circ 46' 8'' = 0.45736$.

Find $\log \cos 47^\circ 35' 4''$.

Page 48. $\log \cos 47^\circ 35' = 9.82899 - 10$.

The difference between this mantissa and the mantissas of the next $\log \cos$ is 14, and $\frac{4}{60}$ of 14 = 1.

As the function is decreasing, the 1 must be subtracted from the figure in the fifth place of the mantissa 82899; and

Therefore $\log \cos 47^\circ 35' 4'' = 9.82898 - 10$.

Find the angle for which $\log \sin = 9.45359 - 10$.

Page 35. The mantissa of the nearest smaller $\log \sin$ in the table is 45334.

The angle corresponding to this value is $16^\circ 30'$.

The difference between 45334 and the given mantissa, 45359, is 25.

The difference between 45334 and the next following mantissa, 45377, is 43, and $\frac{25}{43}$ of $60'' = 35''$.

As the function is increasing, the $35''$ must be added to $16^\circ 30'$; and the required angle is $16^\circ 30' 35''$.

Find the angle for which $\log \cot = 0.73478$.

Page 32. The mantissa of the nearest smaller $\log \cot$ in the table is 73415.

The angle corresponding to this value is $10^\circ 27'$.

The difference between 73415 and the given mantissa is 63.

The difference between 73415 and the next following mantissa is 71, and $\frac{63}{71}$ of $60'' = 53''$.

As the function is decreasing, the $53''$ must be subtracted from $10^\circ 27'$; and the required angle is $10^\circ 26' 7''$.

27. If $\log \sec$ or $\log \csc$ of an angle is desired, it may be found from the table by the formulas,

$$\sec A = \frac{1}{\cos A}; \text{ hence, } \log \sec A = \text{colog } \cos A.$$

$$\csc A = \frac{1}{\sin A}; \text{ hence, } \log \csc A = \text{colog } \sin A.$$

$$\text{Page 31. } \log \sec 8^\circ 28' = \text{colog } \cos 8^\circ 28' = 0.00476.$$

$$\text{Page 42. } \log \csc 59^\circ 36' 44'' = \text{colog } \sin 59^\circ 36' 44'' = 0.06418.$$

28. If a given angle is between 0° and 1° , or between 89° and 90° ; or, conversely, if a given $\log \sin$ or $\log \cos$ does *not* lie between the limits 8.24186 and 9.99993 in the table; or, if a given $\log \tan$ or $\log \cot$ does *not* lie between the limits 8.24192 and 11.75808 in the table; then pages 21-24 of Table III. must be used.

On page 21, $\log \sin$ of angles between 0° and $0^\circ 3'$, or $\log \cos$ of the complementary angles between $89^\circ 57'$ and 90° , are given to every second; for the angles between 0° and $0^\circ 3'$, $\log \tan = \log \sin$, and $\log \cos = 0.00000$; for the angles between $89^\circ 57'$ and 90° , $\log \cot = \log \cos$, and $\log \sin = 0.00000$.

On pages 22-24, $\log \sin$, $\log \tan$, and $\log \cos$ of angles between 0° and 1° , or $\log \cos$, $\log \cot$, and $\log \sin$ of the complementary angles between 89° and 90° , are given to every $10''$.

Whenever $\log \tan$ or $\log \cot$ is not given, they may be found by the formulas,

$$\log \tan = \text{colog } \cot. \qquad \log \cot = \text{colog } \tan.$$

Conversely, if a given $\log \tan$ or $\log \cot$ is not contained in the table, then the colog must be found; this will be the $\log \cot$ or $\log \tan$, as the case may be, and will be contained in the table.

On pages 25-27 the logarithms of the functions of angles between 1° and 2° , or between 88° and 90° , are given in the manner employed on pages 22-24. These pages should be used if the angle lies between these limits, and if not only degrees and minutes, but degrees, minutes, and multiples of $10''$ are given or required.

When the angle is between 0° and 2° , or 88° and 90° , and a greater degree of accuracy is desired than that given by the table, interpolation may be employed; but for these angles interpolation does not always give true results, and it is better to use Table IV.

The corresponding angle for which is $89^\circ 42' 40''$.

Find the angle for which $\log \cot = 2.37368$.

This $\log \cot$ is not contained in the table.

The $\log \cot = 7.62632 - 10 = \log \tan$.

The $\log \tan$ in the table nearest to this is (page 22) $7.62510 - 10$, and the angle corresponding to this value of $\log \tan$ is $0^\circ 14' 30''$.

29. If an angle x is between 90° and 360° , it follows, from formulas established in Trigonometry, that,

| | |
|--|---|
| <p>between 90° and 180°,</p> <p>$\log \sin x = \log \sin (180^\circ - x),$</p> <p>$\log \cos x = \log \cos (180^\circ - x),$</p> <p>$\log \tan x = \log \tan (180^\circ - x),$</p> <p>$\log \cot x = \log \cot (180^\circ - x);$</p> | <p>between 180° and 270°,</p> <p>$\log \sin x = \log \sin (x - 180^\circ),$</p> <p>$\log \cos x = \log \cos (x - 180^\circ),$</p> <p>$\log \tan x = \log \tan (x - 180^\circ),$</p> <p>$\log \cot x = \log \cot (x - 180^\circ);$</p> |
|--|---|

between 270° and 360° ,

$\log \sin x = \log \sin (360^\circ - x),$
 $\log \cos x = \log \cos (360^\circ - x),$
 $\log \tan x = \log \tan (360^\circ - x),$
 $\log \cot x = \log \cot (360^\circ - x).$

The letter n is placed (according to custom) after the logarithms of those functions which are negative in value.

The above formulas show, without further explanation, how to find by means of Table III. the logarithms of the functions of any angle between 90° and 360° .

$$\begin{aligned}\text{Thus, } \log \sin 137^\circ 45' 22'' &= \log \sin 42^\circ 14' 38'' = 9.82756 - 10. \\ \log \cos 137^\circ 45' 22'' &= \log_n \cos 42^\circ 14' 38'' = 9.86940_n - 10. \\ \log \tan 137^\circ 45' 22'' &= \log_n \tan 42^\circ 14' 38'' = 9.95815_n - 10. \\ \log \cot 137^\circ 45' 22'' &= \log_n \cot 42^\circ 14' 38'' = 0.04185_n. \\ \log \sin 209^\circ 32' 50'' &= \log_n \sin 29^\circ 32' 50'' = 9.69297_n - 10. \\ \log \cos 330^\circ 27' 10'' &= \log \cos 29^\circ 32' 50'' = 9.93949 - 10.\end{aligned}$$

Conversely, to a given logarithm of a trigonometric function there correspond between 0° and 360° four angles, one angle in each quadrant, and so related that if x denote the acute angle, the other three angles are $180^\circ - x$, $180^\circ + x$, and $360^\circ - x$.

If besides the given logarithm it is known whether the function is positive or negative, the ambiguity is confined to *two* quadrants, therefore to *two* angles.

Thus, if the $\log \tan = 9.47451 - 10$, the angles are $16^\circ 36' 17''$ in Quadrant I. and $196^\circ 36' 17''$ in Quadrant III.; but if the $\log \tan = 9.47451_n - 10$, the angles are $163^\circ 23' 43''$ in Quadrant II. and $343^\circ 23' 43''$ in Quadrant IV.

To remove all ambiguity, further conditions are required, or a knowledge of the special circumstances connected with the problem in question.

TABLE IV.

30. This table (page 50) must be used when great accuracy is desired in working with angles between 0° and 2° , or between 88° and 90° .

The values of S and T are such that when the angle a is expressed in seconds,

$$\begin{aligned}S &= \log \sin a - \log a'', \\ T &= \log \tan a - \log a''.\end{aligned}$$

TABLE V.

31. This table (p. 51), containing the circumferences and areas of circles, does not require explanation.

TABLE VI.

32. Table VI. (pp. 52-69) contains the natural sines, cosines, tangents, and cotangents of angles from 0° to 90° , at intervals of $1'$. If greater accuracy is desired it may be obtained by interpolation.

NOTE. In preparing the preceding explanations, we have made free use of the Logarithmic Tables by F. G. Gauss. For Table VI. we are indebted to D. Carhart.

TABLE VII.

33. This table (pp. 70-75) gives the latitude and departure to three places of decimals for distances from 1 to 10, corresponding to bearings from 0° to 90° at intervals of $15'$.

If the bearing does not exceed 45° it is found in the *left-hand* column, and the designations of the columns under "Distance" are taken from the *top* of the page; but if the bearing exceeds 45° , it is found in the *right-hand* column, and the designations of the columns under "Distance" are taken from the *bottom* of the page.

The method of using the table will be made plain by the following examples:—

(1) Let it be required to find the latitude and departure of the course N. $35^\circ 15'$ E. 6 chains.

On p. 75, left-hand column, look for $35^\circ 15'$; opposite this bearing, in the vertical column headed "Distance 6," are found 4.900 and 3.463 under the headings "Latitude" and "Departure" respectively. Hence, latitude or northing = 4.900 chains, and departure or easting = 3.463 chains.

(2) Let it be required to find the latitude and departure of the course S. 87° W. 2 chains.

As the bearing exceeds 45° , we look in the right-hand column of p. 70, and opposite 87° in the column marked "Distance 2" we find (taking the designations of the columns from the bottom of the page) latitude = 0.105 chains, and departure = 1.997 chains. Hence, latitude or southing = 0.105 chains, and departure or westing = 1.997 chains.

(3) Let it be required to find the latitude and departure of the course N. $15^\circ 45'$ W. 27.36 chains.

In this case we find the required numbers for each figure of the distance separately, arranging the work as in the following table. In practice, only the last columns under "Latitude" and "Departure" are written.

| DISTANCE. | LATITUDE. | DEPARTURE. |

| 20 = 2×10 | $1.925 \times 10 = 19.25$ | $0.543 \times 10 = 5.43$ |
| 7 | 6.737 | 1.90 |
| 0.3 = $3 \div 10$ | $2.887 \div 10 = 0.289$ | $0.814 \div 10 = 0.081$ |
| 0.06 = $6 \div 100$ | $5.775 \div 100 = 0.058$ | $1.628 \div 100 = 0.016$ |
| 27.36 | 26.334 | 7.427 |

Hence, latitude = 26.334 chains, and departure = 7.427 chains.

TABLE IV.

FOR DETERMINING WITH GREATER ACCURACY THAN CAN BE DONE BY
MEANS OF TABLE III.:

1. $\log \sin$, $\log \tan$, and $\log \cot$, when the angle is between 0° and 2° ;
2. $\log \cos$, $\log \tan$, and $\log \cot$, when the angle is between 88° and 90° ;
3. The value of the angle when the logarithm of the function does *not* lie between the limits 8.54 684 and 11.45 316.

FORMULAS FOR THE USE OF THE NUMBERS S AND T.

I. When the angle α is between 0° and 2° :

$$\begin{aligned}\log \sin \alpha &= \log a'' + S. \\ \log \tan \alpha &= \log a'' + T. \\ \log \cot \alpha &= \text{colog } \tan \alpha.\end{aligned}$$

$$\begin{aligned}\log a'' &= \log \sin \alpha - S, \\ &= \log \tan \alpha - T, \\ &= \text{colog } \cot \alpha - T.\end{aligned}$$

II. When the angle α is between 88° and 90° :

$$\begin{aligned}\log \cos \alpha &= \log (90^\circ - \alpha)'' + S. \\ \log \cot \alpha &= \log (90^\circ - \alpha)'' + T. \\ \log \tan \alpha &= \text{colog } \cot \alpha.\end{aligned}$$

$$\begin{aligned}\log (90^\circ - \alpha)'' &= \log \cos \alpha - S, \\ &= \log \cot \alpha - T, \\ &= \text{colog } \tan \alpha - T, \\ \text{and } \alpha &= 90^\circ - (90^\circ - \alpha).\end{aligned}$$
